Going through the gears

Just the right mix

Sun warms the equity funds

The car industry in Asia overtakes

Three's a charm

In SKAGEN we are very fond of numbers, particularly the number 3. 2013 was yet another good year ending in 3.

In December 2012 I went out on a limb when I sent Christmas cards to our SKAGEN friends. In the card I wrote that next year (2013 that is) would be a good year if history were to repeat itself. Eight out of the ten previous years ending in three had been good years on the stock market, and that was certainly true of 2013 also.

Good return

Our funds performed fairly well last year. Measured in GBP, SKAGEN Kon-Tiki delivered eight percent to unit holders in a difficult market, beating its benchmark index by 12 percentage points. The other two equity funds, SKAGEN Global and SKAGEN Vekst, delivered solid absolute returns of 18 and 13 percent respectively. The two funds ended up slightly behind their benchmark indices, however. The global property fund SKAGEN m2 had a tough first year. The fund's benchmark index is heavily exposed to the real estate markets in Japan and the US, both of which had a good year, while SKAGEN m2 has few investments in these real estate markets and suffered because of this. SKAGEN's fixed income fund SKAGEN Tellus deserves much more attention than it receives, in my view. In a tough market it was down 2 percent, 4 percentage points ahead of its index.

The number three

Although we are quite tongue in cheek when it comes to our number superstition, 1993 was indisputably a good year for the company, as that was the year that SKAGEN was established. We have spent some time this year celebrating our 20th anniversary, including holding a very well-received outdoor concert in Stavanger in August as well as a number of client events. One positive thing about growing older is that we have become more experienced. We know much more today than when we first started 20 years ago, and that is to the benefit of unit holders. But some things do not change in SKAGEN: The three (there you have it again) Us – our investment philosophy which consists of searching for Undervalued, Unpopular and Under-researched companies – was conceived 20 years ago. Today value investing has arguably fallen out of favour, but it won't be long before it becomes fashionable once again.

Market of opportunity

The theme for this annual report is undiscovered opportunities, or pockets of value. This is at the very core of our investment philosophy, namely looking for quality companies in places where others would not think of looking. Why do we talk about our investment philosophy all the time? Because we are of the firm belief that quality at the right price is in the best interests of our unit holders in the long run.

And it is precisely this long-term perspective that characterises our management and business style. If you look for our funds' in newspapers' listings of the best funds in the past week or past month, you most likely won't find us there. We are not concerned about being the best over such short time frames. It may sound arrogant, but fund saving is a long-term business.

Above average

Assets under management were GBP 12.7 billion at the end of the year. During the year we saw that some clients lost faith in emerging markets and took money out of SKAGEN Kon-Tiki, even though the fund beat its benchmark index by a solid margin. Clients paid an average 2.25 percent management fee during the year, which is above the industry average, and can be attributed precisely to the large excess return achieved by SKAGEN Kon-Tiki.

What next?

I won't stretch the numbers theory too far; it is, after all more fundamental factors which decide the fate of the companies in our portfolios. What do we expect to see next year? Two things: given the unusually stable period behind us, we must now expect slightly more fluctuations and corrections. This far in the upturn there is more room for faith and doubt. But if you ask me, I think 2014 will be another good SKAGEN year. Thank you for accompanying us on our journey!

POCKETS OF VAL<u>UE</u>

The theme for this annual report is undiscovered opportunities, or pockets of value. This is at the very core of our investment philosophy, namely looking for quality companies in places where others would not think of looking. Why do we talk about our investment philosophy all the time? Because we are of the firm belief that quality at the right price is in the best interests of our unit holders in the long run.

– Harald Espedal CEO

We would like to invite unit holders in SKAGEN Funds to our electoral meeting which will be held at the Stavanger Concert Hall on 5 March 2014 at 6pm.

The electoral meeting will be broadcast live on our Norwegian language website www.skagenfondene.no so that as many people as possible may follow the proceedings.

Agenda for the electoral meeting:

- 1 Election of chairperson and two unit holders to sign the minutes for discussion
- 2 Board of directors' annual report for information
- 3 Auditor's report for information
- 4 Election of two board members to the board of directors of SKAGEN AS for discussion
- 5 Election of one deputy board member to the board of directors of SKAGEN AS for discussion
- 6 Election of two members to the nomination committee for discussion
- 7 Questions sent in from unit holders for discussion

The nomination committee proposes that Yuhong Jin Hermansen be re-elected as a unit holder-elected board member for a term up to 2016. The nomination committee further proposes that Per Gustav Blom be re-elected as a unit holder-elected board member for a term up to 2016, and that Martin Petersson be re-elected as a unit holder-elected deputy member for a term up to 2015.

The board of directors proposes that Per Olof Höglund be elected as a new member in the nomination committee for a term up to 2017 since Ola Lauritzson has stepped down. The board further proposes that Barbro Johansson be elected as a new member of the nomination committee for a term up to 2016 as Mette Lundh Haakestad's three-year term has now come to an end.

Advance voting on My Page

Unit holders may cast advance votes via My Page (log in from www.skagenfunds.com). Alternatively you may send in your votes by email to legal@skagenfunds.com or by post to SKAGEN, P.O. Box 160, 4001 Stavanger, Norway. Advance votes must reach SKAGEN at the latest by 28 February 2014. Your units as

More information and a registration form can be obtained by contacting Customer Services on +47 51 21 38 58. The deadline for registration is 28 February 2014. The meeting is open to everyone. Light refreshments will be served. of 28 February will constitute the basis for the calculation of the number of votes. If you have voted in advance, you do not need to register on arrival at the meeting.

Each unit is entitled to one vote at the unit holders meeting. Unit holders may vote by proxy. Approved proxy forms are available by contacting Customer Services on +47 51 25 38 58. Please remember to bring a proof of identity and, where relevant, a certificate of incorporation.

Unit holders are entitled to discuss questions which are submitted in writing to the board of directors of SKAGEN AS up to one week prior to the meeting. With the exception of the elections, the election meeting may not make any resolutions that bind the funds or the asset management company.

Funds discussion

After the formal part of the electoral meeting, Investment Director Harald Espedal will talk about the outlook going forward. There will then be a discussion about the funds with the portfolio managers and Investment Director Harald Espedal. Unit holders may ask questions either via text messages or in person.

Best regards The Board of Directors of SKAGEN AS

Martin Gjelsvik Chairman of the Board of Directors

Time to say goodbye

The 'developed world' and 'developing world' are crude labels for categorising the world's six billion people according to Hans Rosling, a Swedish professor, who suggests that we put these terms aside in favour of another, more accurate term: the world.

- Hans Rosling interviewed by Michael Metzler, Communication Manager

Once upon a time, not too long ago, our world could in fact easily be grouped into two sets of countries, "developed" and "developing". There was a great divide between those countries considered rich and those considered poor – and very few, if any, in between. One group had a long average life expectancy, small families, education and political power. The other had neither.

- I like to tell the story of my neighbour who knows two hundred varieties of wine, I am only familiar with two; red and white. While my neighbour is only aware of two types of countries – industrialised and developing. I on the other hand know about 200 countries and their GDP, fertility rates, levels of literacy, child mortality and so on, says Hans Rosling, professor of global health at the Karolinska Institute in Stockholm.

Health and wealth

- The countries of the world today defy all attempts to be classified into only two groups. So many of the formerly "developing" countries have been catching up – and most of the global growth today is taking place outside Northern America and Western Europe.

Through his Gapminder organisation Hans Rosling aims at making statistics and facts more accessible and available – showing how most people these days live in the middle of the socioeconomic spectrum.

- The average life expectancy today in Vietnam, for example, is 75 years. This is the same level as in the US in 1990, although from the perspective of wealth, income per person is on a par with the US in the 1860s! In terms of health they are 20 years behind and in terms of wealth 150 years behind. The paradox related to improved child survival is that it doesn't lead to population growth. Rather, the opposite is true. Hans Rosling explains that it is when child mortality drops that the demand for family planning increases, hence leading to fewer births. Most of the world's population lives in a society where two child families are most common and child mortality is relatively low. On average, women in the world today give birth to 2.5 babies. This has led to what Rosling refers to as 'the age of 'peak-child''. The number of children has levelled off at 2 billion in the last decade and will probably remain at this level throughout this century. In Africa the number of children is still increasing but the number is decreasing at the same speed in Asia.

Upgrading our world view

In the mid-1990s Hans Rosling came to realise that the crème de la crème of the academic elite at the Karolinska Institute, the Swedish medical university, were lacking basic knowledge of how the world had changed – much due to a remaining outdated mindset. This is what inspired him to embark on his mission to "upgrade our world view", as he likes to put it.

When Hans Rosling asked his students to define the terms 'the western world' and 'the developing world' they would explain that the western world had smaller families and longer life expectancies. Their view of the world would have been accurate in 1960. Since then, there has been an on-going slow but dramatic change that renders the old way of dividing the world into two groups totally useless. In one of Hans Rosling's famous TED-speeches he holds up a UN report from 2009 on levels and trends in child mortality. He states that it is a great report apart from the page that categorises countries. On the list of developing countries he points to The Republic of Korea, the country that has given us the electronics giant Samsung. Singapore, the country with the lowest child mortality in the world is also considered a developing country as is the richest country in the world, Qatar. Hans Rosling asks how these countries can be considered 'developing' and then goes on to tear up the page on country categorisation exclaiming "This is crap!"

WORLD MARKETS

Hans Rosling

Self proclaimed 'edu-tainer' and professor of global health, Karolinska Institute, Stockholm.

Co-founder of the Gapminder foundation, with its mission of "Fighting devastating ignorance with fact-based worldviews everyone can understand".

In 2007, Google acquired software Trendalyzer from the Gapminder Foundation.

The current version of Trendalyzer is available as web-service (www. gapminder.org/world) displaying time series of development statistics for all countries.

POCKETS OF VALUE

Growth and rapid change

Emerging market countries have not spent billions of dollars building shopping malls, media houses and financial institutions which means that they can leap right into the digital future. This is just one of the many things that investors in emerging markets don't realise.

- Kristoffer Stensrud, Portfolio Manager

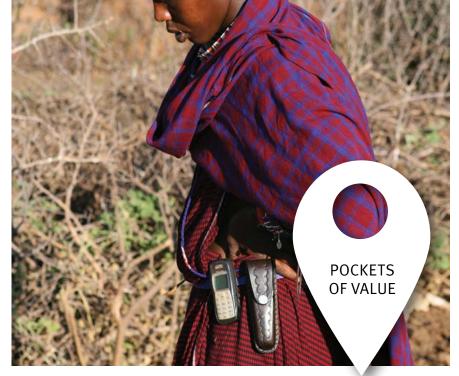

At our New Year's Conference in Copenhagen it was telling that the audience believed that more than 50 percent of the world's population was illiterate and that fewer than 50 percent of the world's infants were vaccinated against measles before their first birthday. The correct answers are that fewer than 20 percent are illiterate and vaccination rates are north of 80 percent. That nearly half a billion people have moved from poverty to middle class is a fact that seems to have passed by a generally enlightened public.

What is truly interesting is that Nobel Prize laureate Paul Krugman, has not seemingly grasped the fact that the Chinese economy is more than three times as big as the Japanese as measured by purchasing power. A question regarding China's future was dismissed with a response of: "it'll go the way of Japan". China's share of world trade is currently three times that of Japan. Raw material consumption in China is between three and eight times greater than that of Japan — not to mention significantly greater than that of the US. In 2013, China also eclipsed the US as the world's biggest trading nation as measured by the sum of exports and imports of goods.

A new world

That Krugman is considered one of the world's top economists and leading opinion makers might seem disheartening in this context. However, it just goes to show that economists and investors continue to remain blinkered by their old prejudices as laid out in textbooks and the media from the 1970s until the late 1990s. The world has certainly changed in fundamental ways since then.

Traditionally, investments in global emerging markets have been perceived to be a leverage investment to deal with global business cycles. To invest in emerging markets when economic trends are falling – in other words, trading

counter-cyclically – can be a generally distressing experience, a little like trying to catch a falling knife in mid-air.

The period between 1993 and the turn of the millennium illustrates this well. To a large degree, growth in the industrialised world was a manifestation of the internet boom. On the other hand, the global emerging markets were struggling. Excessive borrowing, primarily in dollars, was driven by an ample supply of credit. The combination of a decline in demand and overpriced exchange rates culminated in the Asian crisis in 1997/98.

The past five years of the same type of affordable credit have contributed to inflated exchange rates in several emerging countries and a weakening of several countries' foreign trade since 2010. This has invited easy parallels with the 1990s which are not particularly relevant.

Emerging markets in a stronger position

The global emerging markets of today no longer play the role of derivatives within the global commodities cycle. The countries' economies are now sufficiently large and no longer as dependent on exporting to western countries as previously. The steep declines we witnessed in 2013 in a number of emerging countries provided a welcome correction and a natural stabiliser; this did not occur in the 1990s when the prevailing economic orthodoxy was based on constant exchange rates.

On the contrary, most of the economies now seem more dependent on internal growth. There is an interesting development in the service sector, which accounts for upwards of 80 percent of value creation in industrialised countries. South Africa is an example of a country that is perceived to be a commodity-driven mining economy – but most of the South African stock market index is anchored in the service sector. However, in global emerging

CONSENSUAL SCEPTICISM

Many investors are undoubtedly missing something by viewing the world through the prisms of old paradigms and past events. In spite of everything - the increased purchasing power, the development of the service sector, the spread of digital commerce, and the potential for an improved political climate the investing public remains sceptical. It may therefore be the case that this consensual scepticism will create good investment opportunities in carefully selected companies in the future.

markets in general, the service sector is often part of the informal economy. But as this part of the economy grows, it will need to be taxed at which point it will start contributing to the official GDP.

Into the future

Since emerging countries have not poured billions of dollars into building shopping malls, media houses and financial institutions, they are able to skip a phase that western economies have had to go through and leap straight into the digital world. What is more, it is based on full transparency and new efficient distribution systems. This has the potential to enable drastic savings of resources with growing numbers of people having access to smartphones and free information for all. Many investors are undoubtedly missing this by viewing the world through the prisms of old paradigms and past events.

This is not to say that the shift in the emerging markets will be without friction. In 2013, we saw clear signs of impatience among the go-getting middle classes in many emerging markets. Political and institutional problems are evident in many countries. In spite of a historically golden decade of political stability, there is a strong desire for regime change as political stability has paved the way for red tape and corruption.

The combination of economic and political uncertainty will likely be greater than usual in 2014 with a potentially dampening effect on the global emerging markets. For example, already in 2013, we saw a policy shift in China that will alter decades-old prejudices about the nation state's sovereignty position in relation to globalisation, a greater emphasis on individual economic freedom, and greater emphasis on qualitative rather than quantitative growth.

Whether or not global emerging markets – as defined by indexes – will be a better investment than traditional developed markets in 2014 remains to be seen. Based on key figures for the cost of value creation in companies, we are approaching a level where we would normally be certain that global emerging markets should have better riskadjusted returns in a couple of years. But there are no guarantees.

What we can guarantee is that the uncertainties that may arise in 2014 will provide us with opportunities for finding good companies with excellent value creation at low prices and good revaluation opportunities in a changed climate – as was the case in 1998, 2002 and 2008. For many managers, periods of short-term anxiety in the markets cause crises; for SKAGEN, such periods have given rise to opportunities over the past 21 years. With a solid anchoring in value, we will remain poised to outperform the markets.

In other words, in spite of everything – the increased purchasing power, the development of the service sector, the spread of digital commerce, and the potential for an improved political climate – the investing public remains sceptical. It may therefore be the case that this consensual scepticism will provide good investment opportunities in carefully selected companies in the future.

Supporting young people

SKAGEN's cooperation with Doctors Without Borders, SOS Children's Villages and Kolibri – Children at Risk Foundation has taught us how valuable it is to focus on the undervalued, under-researched and unpopular – also when it comes to our social responsibilities.

– Margrethe Vika

Common to the three organisations is that they work within areas or with themes that are unpopular, under-researched and undervalued and with ardent commitment.

Contributing to medical relief, safe homes for children without parental care and better lives for children in poverty is valuable in itself. It is also of value because it provides children and young people with the opportunity to develop.

Extending the cooperation

In 2013 we extended our cooperation with the organisations and a total of EUR 835 000 was

distributed between various projects. Doctors Without Borders has earmarked the money for work in Sierra Leone and Niger. We have seen how medical relief to Africa is not particularly highly regarded work and Doctors Without Borders call this the forgotten crisis. In SOS Children's Villages the capital will be used to support work in Pskov, Russia. The Kolibri project in Brazil continues to provide facilities for children and young people, one of which is the holiday and recreational centre KolibriEgg Itanhaém on the coast, which was completed in 2010.

Brazil Many of the children who grow up in the favelas in São Paulo have never left the city. At KolibriEgget Itanhaém, they see the ocean for the first time and learn about the Atlantic rain forest. The boy pictured above visited the centre during the school holidays and, inspired by the rain forest and African tribal traditions, dressed up using coloured clay and other items found in the forest. The children learn about nature as well as their African cultural heritage.

POCKETS OF VALUE

A world of opportunities

Crisis is the mother of progress, claims Kristoffer Stensrud. A seemingly bad time to start an equity fund can actually prove to be an advantage.

- Tore Bang, Communication Manager

"For many years we have achieved strong returns for our unit holders by focusing on things that others have neglected. During the Asian crisis we looked East, whilst others were looking West," says Kristoffer Stensrud, referring to the launch of SKAGEN Global in 1997.

Ever since SKAGEN was established 20 years ago our portfolio managers have focused their attention on companies in parts of the world other investors have preferred to avoid.

"It is important to re-evaluate established truths, while the mathematical law of gravity dictates that the market's assessment of companies converges over time. That provides scope for generalists like ourselves, who are armed with broad mandates and are willing to take a closer look at what may be hidden to many others in the market," explains Stensrud.

Although SKAGEN's funds have different mandates and the portfolio managers all enjoy a high degree of freedom, the funds share at least one thing in common: they all experienced a difficult birth. 1993 NORWEGIAN LOW POINT

Skagen Vekst

Background at start-up: Deregulation of credit in the mid 1980s resulted in a booming Norwegian housing market. Benevolent banks approved mortgages up to the hilt. The recovery lasted until the winter of 1988, and then the curtain came down. Over the next five years house prices in Norway fell by 40 percent. Previously solid big banks went bankrupt, shareholders lost everything, and the credit market was paralysed. The Oslo Stock Exchange, unlike global stock markets, never recovered after the bloody Monday stock market crash on the New York Stock Exchange on 19 October 1987.

Up until August 1992 investment in Norwegian equities was a rarity. However, in 1993 investors once again started to believe that longterm investment in companies' equity could pay off. The Oslo Stock Exchange ended the year up 65 percent. 1993 was also a joyous year for global equity markets.

Missed out on a great year

Its 1 December 1993 launch date meant that SKAGEN Vekst unfortunately missed out on a wonderful year on the stock exchange. But the fund did enjoy the remainder of a favourable decade.

With the exception of 1998, unit holders in SKAGEN Vekst reaped the benefits of the 1990s too, both in absolute terms and relative to the benchmark. The fund peaked in 1999, with a return of 71 percent in GBP, compared to 41 percent for the benchmark.

Twenty years on there are companies in the SKAGEN Vekst portfolio that have been there since the fund's early days. The Fred Olsen twins, Bonheur and Ganger Rolf, Olav Thon Eiendom and Wilhelm Wilhelmsen are just a few of the Norwegian classics. Among the foreigners Samsung Electronics is SKAGEN Vekst's largest investment, and once again made an excellent contribution to the fund's performance in 2013.

1997 ASIA CRISIS

SKAGEN GLOBAL

Background at start-up: The Asian crisis was in full swing and investors were fleeing from the debt-ridden Asian markets with many Asian countries struggling with high debt and a strong dollar. The situation was not as bad for companies; many had relatively low debt levels and the necessary liquidity to manage the crisis. Tough cost cuts and a weak currency meant that these emerged as future winners once the crisis started to abate.

Struck gold during the Asian crisis: Many people felt that it was particularly unfavourable to start a global equity fund in August 1997, in the midst of the Asian crisis. The fact that companies were out of favour with investors played to our advantage, however.

We were able to pick solid, high quality, unpopular, undervalued and underresearched companies at bargain prices. One such company was Samsung Electronics, which entered the SKAGEN Global portfolio in the winter of 1997. There could have been no better Christmas gift for us or our unit holders, and the investment continued to pay off in subsequent years. In 2013 Samsung Electronics was again one of the largest positive contributors to our equity funds.

Unit holders who invested in SKAGEN Global at launch had to endure a loss of three percent in the first five months of the fund's life, while the MSCI World Index was down seven percent in GBP. However, over the next two years our unit holders got value for their money; the fund gained 42 percent in 1998 and 106 percent in 1999 while the benchmark index was up 22 percent in 1998 and 26 percent in 1999.

The ensuing decade as a whole was also good for SKAGEN Global, which ended up being well rewarded for its relatively heavy investment in undervalued companies in emerging markets. 2002 STOCK MARKET CRASH

Skagen Kon-Tiki

Background at start-up: The terror attack on 11 September 2001 resulted in increased monetary stimulus from the Fed. The US economy had been struggling since the spring of 2000. At the end of the year key indicators showed that the global economy was improving and optimism gradually returning. China was in the infancy of its economic golden age. 2002 looked brighter and investors saw positive returns for the first time in years. But then two US accounting bombs went off: Energy giant, Enron and telecoms company, WorldCom, turned out to be bubbles inflated by lies. deception and foolishness. The finance world once again fell apart.

Loaded the raft with Brazilian bargains: 2002 seemed to be

the perfect time to start an emerging markets fund and the SKAGEN Kon-Tiki raft was launched on 5 April. But after just a few months at sea, unit holders discovered that over 40 percent of the raft was under water. The situation improved slightly towards the end of 2002 and SKAGEN Kon-Tiki ended its first year down 21 percent in GBP. By the end of the year the initial start-up capital had shrunk by half.

The worst of the storm raged in the land of commodities, Brazil. The 2002 elections brought trade union leader Lula da Silva to power, something that didn't exactly encourage investors.

The combination of cheap companies and a run-down currency enabled Kristoffer Stensrud to pick companies off the top shelf. Companies such as Petrobras, Eletrobras, Vale, Antofagasta and Unibanco entered the portfolio.

When the fear started to abate in 2003 unit holders who had stuck with SKAGEN Kon-Tiki were rewarded for their patience. The fund increased by 90 percent, compared to the emerging markets index which returned 40 percent. The fund's total assets increased nearly seven fold, and the number of unit holders more than doubled to just under 10,000.

Patience rewarded

It is relatively rare that we find longlasting winners among first movers in a new market. We tend rather to surf the second wave when the market is more mature and the pioneers have worn themselves out.

– Christian Jessen, Communication Manager

History has proved that investors should be careful about investing in new companies just because they are the first in a new segment or market. Hearing the words "this time it's different" is yet another reason to be on one's guard. Investors should make a concrete assessment, taking into consideration both historical experience and current circumstances. There is often a greater chance of finding good investments among fallen angels than among the latest hottest trends.

Old favourites that have fallen out of the market's favour often end up languishing deep in the abyss when disillusioned investors fold their cards. The key when considering such companies is to find out where the turning point lies, which will lead to improved earnings for the company. This entails going in when the technology, conditions and markets improve – before other investors have got over their fear and bad experiences.

Faith in innovators

Corporate and stock market participants often

Pitfalls for first movers

In retrospect we see that only a few of the participants survived, and it took several years before any lasting market leaders could be identified with any degree of certainty.

Advantages for second movers

Competitors learn from first movers' experiences. The key is going in when the technology, conditions and markets improve

have a firm belief that the first companies in a new market will end up being long-term winners. When groundbreaking inventions are put into production for others, the company is secured a strong income for years to come.

There is something fascinating about successful innovations which turn into viable pioneering activities and put products on shelves. Business leaders and the press welcome the stories; it takes a combination of extremely hard work and creativity to push through something new.

Equity analysts and investors struggle to get an overview of the opportunities in a new sector, but they must be good; the companies would not have managed to get past the birthing phase and onto the stock market otherwise.

Equity investors fight over companies and fear being left on the sidelines. The hangover comes when the companies disappoint in their quarterly statements and their growth prospects fade. Suddenly, a success turns into a stock market fiasco and investors suffer the consequences.

Common sense

Does this story sound familiar? Most likely. The solar industry is a classic development story which has given SKAGEN the opportunity to acquire cheap companies in a growing sector.

Why do we see the same thing happen time after time? Our opinion is that many market participants look back instead of ahead in time, as well as being overly guided by their instincts. If an investor has previously lost a lot of money on a company or a sector, it takes a lot for him

LATER BLOOMING TECHNOLOGIES

Who can win if they are not the first off the block? It is often the next in line. Some of the so-called firstmover advantages include gaining customers without competition, having a technological head start and enjoying the selfperpetuating process created by the very fact of having users and customers. But the winners are those who first get critical mass. One such example is Google which swept Yahoo and Alta Vista off the field.

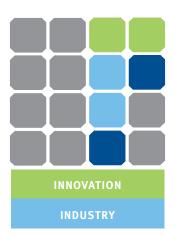

to get back into the ring. Even for professionals this can make it difficult to have a more nuanced view.

Singer and Hoover, pioneers in sewing machines and vacuum cleaners respectively, are often cited as examples of first mover advantage. They were not the first to come out with their products, however, they were the first to experience commercial success. So they were second rather than first movers.

Pitfalls

Pitfalls are manifold for first movers. Large investments in technology and innovation can prove advantageous, but the benefits are short-lived if competitors are later able to copy and produce at lower costs. If a company has wrongly estimated its market size, it can end up being choked by overly high development costs relative to earnings.

Another problem may arise when a visionary

JUST THE RIGHT MIX

SUN WARMS THE EQUITY FUNDS

– Ole Søeberg, Portfolio Manager

Solar energy producers are a good example of a typical SKAGEN investment: They are unpopular among equity investors after an 80 percent decline in share prices, and they are affordably priced, based on future earnings.

Globally, solar energy is quickly becoming the least expensive form of energy and production costs are plummeting. Even the traditional oil and energy company BP predicts that by 2020 solar energy will represent around two percent of the world's overall energy production – without relying on subsidies.

SKAGEN's investment philosophy is value-based but also applies a hefty dose of common sense. That is why we have gone somewhat against our usual approach of focusing on undervalued individual companies and strengthened our position in the sector. The reason for our decision is that the investment case is based on a general misconception of the solar cell industry as a whole; in other words, all companies, not just one. We therefore believe it is worth diversifying our risk by including more companies, all of which have strong competitive positions.

Having for some time been a stock market disaster, the Norwegian solar power company Renewable Energy Corporation (REC) now has the lowest production costs of polysilicon, along with OCI of South Korea and GCL of China. In our view, this is precisely where the value creation takes place and what creates an entry barrier for competitors. Combined, these three companies represent 150,000 tonnes of annual production capacity.

We have also invested

company launches innovative products ahead of its time. Consumers often need time to embrace entirely new technologies, and in the meantime, competitors can learn from the first mover's experiences. Electric cars are another segment where many early participants, such as Buddy and Think, have had to admit defeat.

We cannot end without mentioning the dotcom bubble at the end of the 1990s. Early internet companies insisted on the importance of being first in their respective segments, and investors fell for this, despite history having taught them how difficult it is to pick winners in the early phases of a new market. The auto and airline industries are two such examples which stand out from the last century. In retrospect, we see that only a few of the participants survived, and it took several years before any lasting market leaders could be identified with any degree of certainty. Life as a pioneer is no bed of roses.

Hi-tech, lo-tech

The technology may be advanced, but the principle of solar energy is as logical as life itself. The Uru, a pre-Inca people residing on floating islands on the lake Titicaca, created their unique premises hundreds of years ago. Reeds are used not only to build the islands, but also to make houses and boats. The Uru people, today numbering 2000 inhabitants, live a very simple life. Among the few modern luxuries added, is a radio station broadcasting from the island and the use of solar panels. The latter, although posing in stark contrast to the humble housing, still seems curiously native to the Uru way of life and perfectly illustrates the 360 degree circle of technological progress that lies within this particular technology.

Polysilicon is produced from sand. In simplified terms, in a traditional production scenario sand is boiled to 1,600°C after which polysilicon is filtered and cleaned. However, new methods can handle that process at 'just' 400°C, which makes production less expensive.

in Chinese solar panel manufacturer Yingli and ABB of Europe, which among other things makes inverters and so-called smart grids, which are the next generation of electricity distribution grids.

Challenges remain

Challenges remain, however, in utilising solar energy in traditional electricity grids. These grids were originally designed for major production units such as coal and nuclear power plants with power being distributed to businesses and consumers via high voltage and local grids. In more remote areas, the sun will produce energy during the day but as power is needed around the clock, the battery market will likely develop rapidly in step with solar and wind energy.

This development should evoke enthusiasm, but trends in solar energy sector shares in recent years have scared off many investors.

Ten years ago, solar cell installations were driven by subsidies, known to be unpredictable since they are decided by politicians. Shortterm demand overheated and the price of the raw material, polysilicon, skyrocketed: From USD 50 per kilo in 2004 they rose to USD 475 in early 2008. At that time production costs were around USD 35 per kilo, so a raft of new manufacturers entered the market. This in turn depressed prices and the downturn was fierce and immediate; many manufacturers were forced to close with share prices tumbling.

SKAGEN has been bold enough to take another look at the figures and business plans: Although the companies are unpopular, we are once again seeing pockets of value. Currently, the most effective companies can produce one kilo of polysilicon for around USD 15, which is close to the market price of USD 21. The market is expected to grow by 45 percent by the end of 2015; an increase expected to produce an equilibrium price of around USD 30. In short, promising signs for the most efficient producers.

Going through the gears

How emerging market demand and supply are driving change and growth in the auto industry

- Knut Harald Nilsson, Portfolio Manager

Looking back ten years, the US was firmly the dominant automotive market in the world, representing almost a third of global demand. Very few people, if any, would have predicted that China would overtake the US in only seven years but it did and left America trailing in its rear view mirror in 2010.

In the third quarter of 2013 auto sales in emerging countries accounted for 52 percent of global vehicle sales and they are expected to grow 2-3 times faster than sales in developed countries. It is thanks to this structural EM growth that auto companies have been some of SKAGEN's best ever investments.

Localisation and customisation key

One of the key automotive industry trends for years has been the localisation of production in order to shorten lead times but also, importantly, to reduce currency exposure. Today, all global Original Equipment Manufacturers (OEMs) produce at least 60 percent of their cars outside their 'home' market and some, such as Honda, as much as 80 percent. Hyundai Motor has not added any capacity in its home market during the past 16 years and is unlikely to do so in the years to come.

Just as model names need to be adapted in different markets – Chevrolet had limited success in marketing the Nova in Central and South America as 'No Va' means 'it doesn't go' in Spanish – vehicles themselves need to be increasingly adaptable. In stark contrast to the vision of Henry Ford with his black Model T, buyers of higher-end cars want increasing customisation of features such as colours, upholstery and wheels. There is also a clear trend that customers, at least in the C size segment and upwards, prefer to downscale their models and add more options on their cars; changeable features which offer very high incremental margins for the OEM.

Twenty years ago, development costs for a new model could be up to USD 6 billion. Today, auto manufacturers are developing and launching more new models at a fraction of the cost and time previously required. The key to this is platform sharing. In 2002, Hyundai Motor produced 28 models using 22 platforms, while last year it produced 40 models from just six platforms. We have also seen far greater cooperation across car manufacturers, even between those with no ownership ties. This is especially true for engine technology where BMW for example has cooperated with both Toyota and PSA.

Localisation of product is also important and with platform sharing it has become much cheaper and easier. The Chinese typically want big cars and China is the only market in which BMW offers a stretched version of its 3 series in order to meet this demand. Similarly, Hyundai Motor is now introducing a new model, Mista, made only for the Chinese market. Looking west, station wagons do not sell in the US, and smaller engines of c.150hp and below are not available in full size cars. This stands in stark contrast to the Nordic region, where station wagons are very popular and even smaller engines dominate the sales statistics.

Electric mania misplaced?

Alternative fuel is the new auto industry buzz word in some markets. In Norway, electric vehicles accounted for as much as 12 percent of sales in November, with hybrids adding another nine percent, and it would have been higher still but for delivery bottlenecks.

The frenzy is mainly because pure electric vehicles are currently duty exempt, in a country where vehicles with combustion fuelled engines are taxed by at least 100 percent, but sentiment could change. Although the technology might be environmentally friendly in use, the production of batteries is heavily pollutive and the use of electricity in one country might cause higher coal use in another. Some studies have even concluded that in some markets diesel engines are more environmentally friendly.

We are unsure whether electric engines will be the winning technology as we also expect hydrogen to compete. Battery technology will improve, but traditional combustion engines

Growth market

In just ten years China has overtaken the US as the dominant automotive market in the world. Emerging countries now account for over 50 percent of global vehicle sales. have also improved massively – emissions have fallen and according to the US Environmental Protection Agency the fuel efficiency of new cars in the US has increased by around 20 percent over the past 8 years – and will continue to be used in the vast majority of vehicles globally for the foreseeable future.

Five drivers of profitability and growth in the automotive industry:

1. Differentiated product. A product with greater perceived quality provides pricing power. Good test reviews and competitive second hand prices are key drivers. If you generate a six percent margin, the industry average, and manage to increase your effective price by three percent, your profit would increase by 50 percent.

2. Improved customer service in areas such as financing and warranties.

3. High or increasing capacity utilisation as this is a high fixed cost industry. A single percentage point increase in utilisation can typically increase operating profit by 3-4 percent.

4. Positioned in growth markets. With more than half of global auto sales now coming from emerging countries, it is important to have a strong foothold there to sustain long-term growth. Emerging countries now represent 83 percent of global population and many are under-penetrated with vehicle ownership at a fraction of the levels in developed countries.

5. Positioned in growth segments. The

SUV market in China is currently growing 2-3 times faster than the overall passenger vehicle market partly as it is under-penetrated, but also because Chinese consumers want big cars, particularly when they replace their first vehicles. In emerging markets in general, however, small cars are normally the best sellers and having a competitive offering in this segment is important.

Today, all OEMs have their eyes on China. Obviously the size of the market is an important pull but it is also the extraordinarily high profitability per car versus other markets, especially for luxury cars, that makes it attractive. Adjusted for taxes, luxury car prices in China are usually 10-15 percent higher than in Europe and 20-25 percent higher than in the US. No wonder Audi, BMW and Mercedes are favouring this market and in 2013 China – where the waiting lists for luxury cars are significantly shorter than in developed markets – was the biggest market for BMW, surpassing the US.

Best ever investment

Generally, US consumers are among the most value-for-money focused in the world. If you receive good test reviews and a name for quality, service and reliability, you have a good chance of succeeding in America and if you succeed there, you are likely to do well elsewhere.

EMERGING COUNTRIES

AUTO INDUSTRY

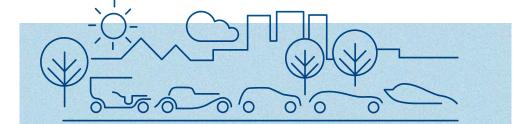

With more than half of global auto sales now coming from emerging countries, it is important to have a strong foothold there to sustain long-term growth. Emerging countries now represent 83 percent of global population and many are underpenetrated with vehicle ownership at a fraction of the levels in developed countries.

Continued: Going through the gears

When we added Hyundai Motor to our portfolio in May 2009, it was partly due to its successful development in the US, where their market share had grown from 1.4 percent in 2000 to 4.5 percent at the beginning of 2008. Our thesis was that the market share gain would be repeated in Europe, and it has. In 2008, Hyundai's European market share was 1.7 percent which more than doubled to 3.5 percent in 2012.

Hyundai Motor has turned out to be the best investment in the history of SKAGEN Kon-Tiki in terms of absolute contribution, delivering GBP 415m as of year-end, with Great Wall Motor in second place having contributed GBP 307m. In total, the auto industry has been a highly profitable one for SKAGEN Kon-Tiki over the past five years and during 2013 our investments in this industry created a return of GBP 400m or 40 percent of the fund's value creation.

Looking ahead, although we cannot predict precisely which direction the auto industry will take, it will no doubt be driven in large part by what happens in the developing world, and we believe our auto companies are all well-placed in their chosen markets – both emerging and developed – to remain in the fast lane and continue to deliver returns for our clients.

AUTO EVOLUTION

TECHNOLOGY DRIVES CONTINENTAL SUCCESS

- Geir Tjetland, Portfolio Manager

Continental entered the SKAGEN Vekst portfolio in November 2011. Back then we believed the company was misunderstood and undervalued as most investors viewed it as a tyre business and didn't appreciate the opportunities in the technology part of the company to exploit the technological revolution taking place in the car industry, where the megatrends are safety, environment, information and affordability.

Safety: Technology and components for vehicle safety are a core competence at Continental; it integrates a full range of active and passive safety systems and is making progress towards its ambition of achieving zero accidents. In technological terms, automated driving represents the logical next step in an evolutionary process where advanced driver assistance systems are networked more closely with real-time data, driver information and drive systems. As a system supplier, Continental is in a strong position to develop and produce solutions for partially automated applications for its customers by 2016. We expect to see the first applications involving highly automated driving from 2020 onwards, and fully automated driving as of 2025.

Environment: Continental is committed to reducing motor vehicle CO2 emissions further. The continuous optimization of fuel and energy consumption will be achieved by reducing engine size with the help of turbocharging and direct-injection technology. Other environmentally-friendly

initiatives are the electrification of the drive train through the development of hybrid and electric power steering, weight-saving designs and proactive driver assistance systems.

Information: The demand for information management in a vehicle is expressed by Continental's "Always on". By linking the driver, the passengers and the vehicle with infrastructure, other vehicles and mobile devices, Continental achieves both keeping the driver informed about relevant driving data and ensuring entertainment and information for all occupants. Examples include head-up displays, voice recognition and text-to-speech technologies.

Affordability: Demand is rising for smaller, low cost cars, not just in Asia and LatAm, but also in developed countries. The global automotive market is changing rapidly and low-cost vehicles are expected to have 20 percent market share globally in a couple of years. The definition of "affordable" cars differs by geography: India GBP 1,700, China & Eastern Europe GBP 3,300 and Western Europe and Japan GBP 8,300. Continental has a scalable product portfolio to satisfy the growing market for this segment.

Continental had on average GBP 250 of technology and products on the 61m cars produced last year. As the technology component continues to increase, then Continental's revenue per car should also rise. The new Mercedes S-class has GBP 5,000 of Continental technology in each car, which is by far the highest ever level for the company.

Continental's share price had a very good run during 2013, up around 80%. We still believe there is more to come as the company should be seen as a technology provider and hence deserve a higher valuation multiple.

INFRASTRUCTURE

THE AUTOMOBILE CENTURY

PROFOUND

– Anna Marcus, Communication Manager

In the beginning, car manufacturing was a slow and expensive process, and few could afford to own a car. Henry Ford's assemblyline manufactured vehicles changed all that. It has been affecting how cities look and how people have behaved for more than a hundred years - it enabled more people to live far from urban centres and drive straight into the city. In the United States, a highway network was created. With today's tougher environmental policy, there is a fervent desire to minimise the use of fossil fuels in the long term. And that is why the electric car has come back in from the cold - with a vengeance.

Shaping the future of cars

When the first electric car was produced in the 19th century, few would have guessed that it would re-emerge as a concept for the future over 100 years later.

– Anna Marcus, Communication Manager

When the first electric car was produced in the 19th century, few would have guessed that it would re-emerge as a concept for the future over 100 years later.

Today, nine out of ten cars, coaches or lorries run on petrol or diesel – and traffic is a major source of greenhouse gas emissions, a contributor to global climate change. In many areas, smog, congestion and an overburdened public transportation system have become everyday worries.

The solution may be electric cars powered by fuel cells: Aerospace technology whereby hydrogen is converted into electrical energy. All that is emitted by the car is water vapours. In other words, as long as the hydrogen is produced using renewable energy, there is no environmental impact. Today, that type of car can manage a 500-kilometre drive and may be ready for mass production by 2020.

"What's needed is major development of infrastructure if we're to apply this technology extensively," says Bengt Dalström, CIO of Toyota Sweden. "The EU has stated its intention to carry out infrastructure developments, and Denmark and other countries already have ambitious rollout plans in the works."

Owner-free and driverless

Costly batteries make it profitable to push down the weight of electric cars using carbon fibre and composites for the chassis and structural Early electric cars: Back in 1902-3, Walter C. Baker built three streamlined electric racing cars. Called "Torpedoes," these allbut-forgotten vehicles should be remembered for four reasons: 1) They allowed Walter Baker to become the first man in history to break the 100 mph barrier in a motorcar; 2) the Torpedoes' bodies were remarkably streamlined, decades ahead of anything similar; 3) because Walter Baker regularly crashed his cars, none of his speed feats went into the record books (in his day, he became known as "Bad Luck Baker"); and 4) what probably saved his life in all those crashes were plain, simple shoulder harnesses, an idea ahead of its time.

A prototype for fuel cell technology was presented by Toyota this January.

components; even bio-based materials have made huge breakthroughs. The impact of these new materials will likely be most evident in how cars are designed in the future. However, according to Dalström, design will not be the main difference in the future:

"One thing is for sure," he says, "when we wake up many years from now, we'll still be able to recognise the cars of the future at a conceptual level. The fundamental functions of travelling, transporting, and protecting oneself from the weather will remain the same."

In addition to fuel and battery capacity, the biggest change will be in how we use cars. We will probably have one vehicle for long-distance transportation and trips and another for city traffic.

"Already in the next five years, we will be seeing programmes similar to bike rental or sharing where you will be able to easily borrow parked, electric city vehicles about the size of a large motorcycle. They will travel at around 45 km/h and have zero emissions."

Another trend is that ownership is declining and that ever fewer people want to deal with inspections, service appointments, repairs and parking. That is why many automotive companies currently offer car sharing and car rentals. In the future, the car will increasingly be able to take care of itself – one example is Google's famous self-driving car, which maps out its surroundings using a laser radar.

Volvo and Scania also have driverless traffic on their drawing boards, and Toyota has been experimenting with driverless public transportation since 2005. Apart from drivers being able to devote their time to activities other than driving, the technology also has the potential to reduce the number of accidents and environmental impact, thereby generating a smoother traffic flow.

Noise and pollution

As early as the turn of the last century, the electric motor was heralded as a superior alternative to the internal combustion engine, which was considered dirty and noisy. Several different European inventors have been credited with creating the first electric car in the first half of the 19th century. The person who first brought it to a wider audience, however, was the tech enthusiast Abdul Hamid II, Sultan of the Ottoman Empire.

In 1888, the sultan read about the German-British engineer Magnus Volk's invention – a one horsepower vehicle – and became so excited that he immediately ordered one for himself. He is reported to have cabled: "No need to discuss price. Send vehicle as soon as possible!" Rumours of the sultan's order boosted interest for electric cars in Europe.

However, the cars' heavy lead batteries and short range meant that electric motor technology was displaced as the internal combustion engine was developed.

Even today, the greatest challenge for electric car manufacturers is precisely battery capacity. In order to make the electric car more competitive, big batteries are required and this, in turn, makes cars more energy intensive. But with an increased focus on the environment and broad research of new battery technologies, there is no doubt that electric power will continue to play an important part in the auto industry.

"In 2030, we'll most likely have batteries with greater storage capacity. There are hundreds of researchers all over the world working on that right now," Bengt Dalström concludes.

A strong year for the UK business as Kon-Tiki rules the waves

- Stephen Millar, UK Managing Director

Coming out of 2012 we had high hopes for 2013; not only were we optimistic as years ending in a three are usually very good for investors but the world economy seemed to be moving on to a more sure footed position and from our perspective, as bottom-up value investors, there were many opportunities presenting themselves to invest in quality companies at very attractive prices. What transpired was one of the most significant divergences in performance between developed and emerging markets, with developed markets outperforming by 29 percentage points. Thankfully our bottom-up stock picking came to the fore in all our equity funds which enabled them to produce very strong absolute returns in the case of SKAGEN Global and best in class relative returns by SKAGEN Kon-Tiki even though both have significant weighting in emerging markets. This weighting we believe will result in both strong relative and absolute returns going forward, given the valuation discount between the two. That said good stock picking will, as always, be the key to taking full advantage of this.

New arrivals

We were delighted to welcome Hilde Jenssen as a Portfolio Manager in the Kon-Tiki team. She will shortly be joined by two other additional Portfolio Managers, Johan Swan and Knut Gezelius. Johan and Knut will be joining the Global team over the next three months. This will mean both the KonTiki and Global teams will each have five Portfolio Managers. The strength in depth and the experience we now have in place means the ability of both teams to identify new and exciting

Hilde Jenssen, a new joiner in our Kon-Tiki team, speaking at the London New Year's Conference 2014.

investment ideas is significantly enhanced such that we are well placed to deliver excellent returns for our clients.

In January we held our third New Year's conference in London. As ever the purpose of these conferences is to provide our clients, their advisors and key prospects with the opportunity to hear from world class investors. This year we were due to have Jim Rogers the renowned investor and Gillian Tett of the Financial Times (FT). Jim made it safely to our shores from Singapore but unfortunately Gillian was not so lucky and her plane did not make it here from New York. We were however very fortunate to get Wolfgang Munchau, also of the FT, to attend at short notice. Jim gave a great presentation with a variety of specific investment ideas ranging from North Korea to farming. Wolfgang gave his views on the global economy with a particular focus on the influence of China and his expectations for Europe.

Looking ahead

As we move in to 2014 I look back on 2013 as another strong year for SKAGEN and for the UK business in particular. We continued to see a lot of interest in our funds from a variety of clients and what was particularly pleasing to see was the development of relationships with a number of key Independent Financial Advisors (IFAs). As always we are very selective with who we work with as understanding how we manage client's assets is essential before we can accept an investment and the IFAs we are working with are some of the most sophisticated. The very strong relative returns from Kon-Tiki and absolute returns from Global, and the continued strong performance of Tellus mean that we are very well placed to see a continuation of this strong interest in 2014.

I wish you all a prosperous 2014 from me and the rest of the UK team and we look forward to working with you and your colleagues over the coming months.

Spotlight on SKAGEN

In May we will be hosting our annual Spotlight on SKAGEN Conference in Stavanger, Norway. This is going to take place on Thursday, 22nd May 2014. The aim of the day is to offer clients the opportunity to gain a deeper insight into SKAGEN. SKAGEN's portfolio managers will be presenting throughout the day as well as participating in an interactive round table discussion. We also offer the opportunity for individual meetings with members of the portfolio teams for those wanting the opportunity for more in-depth questioning. The conference will be held at the Radisson Blu Atlantic Hotel in downtown Stavanger. The day will culminate with a boat trip to experience the spectacular Norwegian coastline.

Please contact your client advisor if you would like more information on this.

Flying high: Chinese workers wash windows at the Shanghai World Financial Centre in Pudong. In 2013 the gap between investors' assessments of companies earnings in developed and emerging markets grew.

Portfolio Managers' report Introduction

> A GOOD YEAR

for developed markets thanks to a healthier global economy, low interest rates and strong company results.

> HISTORICALLY LARGE DIFFERENCES between investors' assessment of

companies' earnings in developed markets compared with emerging markets.

> FURTHER TO GO

in developed and especially emerging markets, if the much-needed structural changes are made.

Mind the gap

Yet another year ending in three has been a favourable one for shareholders, but only for those who invested in developed markets. The gap between developed and emerging market returns was historically wide.

The major theme in the global capital markets in 2013 was investors' willingness to pay more for shares in the developed parts of the world, in particular the US, Europe and Japan. Meanwhile the price of shares in emerging markets plummeted. We have rarely seen a year without corrections in the stock markets but share price fluctuations in 2013 were historically low.

Bond investors had a much more difficult and turbulent ride in 2013. There was a significant rise in interest rates for long-term government bonds in so-called safe havens like the US and Germany in the spring. This may have been the beginning of the end of a 30-year rally for government bonds.

While there is still a great deal of uncertainty regarding the world economy going forward, there are sure to be good opportunities – over limited periods – to earn money on "safe" government bonds.

In the distressed Eurozone, long-term interest rates fell throughout the year, sometimes substantially. This was to the benefit of investors who had bet money on the worst being over.

The continued fall in risk premiums for high yield corporate bonds meant that, on the whole, it was another good year for those who had lent money to companies at the highest end of the risk scale.

Exaggerated fears

As we wrote in our report for 2012, the global economy entered 2013 in a more stable and balanced state than previously. We saw an improvement in the US economy and continued good growth in China. At the same time fears over the tightening measures in the distressed countries of Europe appear to have been exaggerated.

Admittedly global growth was weaker

In local currency, three quarters of the return in global equity markets could be ascribed to the higher pricing of equities or multiple expansion (higher P/E). Dividends and a slight growth in earnings accounted for the rest.

than anticipated. It was more important, however, that the risk of economic catastrophe diminished, particularly in Europe.

Companies have generally speaking been extremely focused on costs. In a time of weak sales growth this led to stable and slightly rising earnings.

A global economy on the mend, low interest rates and decent company earnings were three key factors that resulted in a very good year for developed countries' stock markets. Measured in GBP, the world index was up 20.5 percent.

In local currency, three quarters of the return in global equity markets could be ascribed to the higher pricing of equities or multiple expansion (higher P/E). Dividends and a slight growth in earnings accounted for the rest.

Break in trend and divergence

While we experienced global convergence in the pricing of equities in the decade from 2002 to 2012, that trend was broken in 2013. We saw a significant divergence in the pricing of shares, both between sectors and geographical regions.

Companies with stable earnings and high dividend yields were particularly popular up until the summer. An upturn in long-term interest rates from the end of May was a shot across the bow of these stocks, however. The pricing of these companies had long been too high for our liking.

While equity investors in developed countries' stock markets had an extremely good year, those who had bet on emerging markets saw their investments fall in value, measured in GBP. Companies became cheaper and the valuation gap between emerging and developed markets is at its highest level since 2005.

While the former markets are priced in line with the historic average, you can buy companies in emerging markets at a significant discount. The reason for the discount in emerging markets can be explained by the following:

• Downward adjustment of expectations of economic growth, particularly in India and South America.

• A lack of structural reforms and political unrest have resulted in the belief that the long-term growth story in this part of the world has been undermined.

• Companies' return on equity has been falling over the past couple of years.

Faith and doubt

We expect a moderate improvement in the global economy in 2014, primarily driven by the US and Europe.

The fact that price levels are continuing to be pushed down means that deflation is a greater threat than inflation in most countries. Global interest rates will therefore continue to be low both at the long and short end of the yield curve.

Companies' earnings are expected to rise, but not so much as to give grounds for celebration.

Companies' finances are solid and their coffers historically plentiful. This gives us reason to believe that merger and acquisition activity will continue to increase. Moreover, companies which do not find investments that satisfy their required rate of return will increase their dividend payments to shareholders.

In other words the premise for a continued rise in share prices is in place. History has shown that the pricing of equities ends up being well above the historic average in periods of recovery such as the one we are now in.

For us it is always the valuation of individual companies that counts, however, regardless of which way the market is going. That is why it is reassuring to know that our equity funds are priced at a significant discount to their respective benchmark indexes.

Nevertheless, more expensive equities means more room for faith and doubt, and one should expect greater volatility in 2014.

The greatest risk factor is a significant setback for the global economy which would directly impact companies' bottom lines. Substantial interest rate hikes, which make risk free investments more attractive, are also a threat. Although these threats cannot be entirely ruled out, the danger does not appear to be imminent in 2014.

Largely satisfied with our funds

Our three global equity funds all performed satisfactorily in 2013 in absolute terms. At the top of the list is SKAGEN Global with a return of 18.1 percent measured in GBP, 2.5 percentage points behind the MSCI AC World Index. SKAGEN Kon-Tiki ended the year with a value increase of 7.7 percent, 12.1 percentage points ahead of the MSCI Emerging Markets Index.

SKAGEN Vekst was up 12.5 percent, beaten by its benchmark index by 3.3 percentage points.

In an equity market that is becoming increasingly more selective, in which companies that do not deliver are punished harshly, the negative contributors to our funds were few in number and their impact was minor. The winners' list was long, and the majority of the companies contributed positively to the result (see the respective funds' reports from pages 24).

Finally, the return was due to a combination of generally good growth in earnings from companies, and reratings from extremely low price levels to more moderate levels.

The companies that we believed to be fully priced have - as always - been replaced by more attractive alternatives. Hence at the end of 2013, the valuation of the equity funds is at more or less the same level as at the beginning of the year. The funds are priced at a reassuringly large discount relative to their respective benchmark indices.

Our global property fund, SKAGEN m2, had a disappointing year and ended 2013 down 6.0 percent,

6.8 percentage points behind its benchmark index. The fund's net asset value was negatively impacted by the fund's exposure to Asian countries which were affected by political unrest and weakening currency developments during the summer and autumn.

The bond fund SKAGEN Tellus recognised the risk of a potential rise in interest rates for long-term government bonds and therefore decreased the portfolio's maturity ahead of the substantial rise in interest rates that took place at the end of the second quarter, thereby avoiding significant losses.

SKAGEN Tellus ended the year down 1.7 percent, 4.2 percentage points ahead of its benchmark index.

Debt is no four-letter word

"May I borrow your pen? I need to make notes on this article." You lend your pen and thereby contribute to raising the collective debt level. Is that such a bad thing?

One of the side effects of the financial crisis is that debt is now perceived as an abomination. How often do we read that the debt ratio has reached a certain level and the country is about to go to the wall?

Poor countries have little debt, while rich ones have a lot. Why? Because the willingness to provide credit depends on clear-cut property rights and general trust among the population – legal and social norms that poor countries lack. Hence credit growth tends to outpace economic growth. Rich countries are more "leveraged" than poor ones.

Channelling savings to investment is essential for prosperity, and not all savings can end up as equity. Debt has its place. Sometimes things go wrong of course and, once the equity has evaporated, creditors face the consequences. Nevertheless it is through trial and error with debt instruments, and other securities, that capital markets continuously stumble towards a better way of using scarce resources.

Government debt is not an evil. If it were not possible to issue public debt, tax and excise rates would be volatile and unpredictable. Also, not all government expenditure consists of consumption and transfers. A part of it is used to finance productive public capital.

However, hasn't the debt crisis in the Eurozone shown that public debt can be too high? Of course it can. The public sector does not have shareholders who can take the rap; its creditors are first in line if central government finances go to pot – either through a default or a drop in bond prices – and a spike in the general price level. So when is the debt too high? When expected public surpluses cannot service it. This, in turn, depends on public expenditure and on how tax bases are growing.

Cuts, or at least slower growth, in public expenditure, have been a necessity in some countries. The public sector had become too bloated. However, one often underestimates how important growth in the tax bases is for public finances. Tax revenue grows quickly without any hike in tax rates if there is an upturn in the economy. Even a moderate upturn can have a significant effect.

We have seen this in the US where the deficit has been cut rapidly over the past few years through higher tax revenues due to more economic activity rather than through cuts in public expenditure. Net of interest expenditure, the budget will likely turn positive during the course of this year. This means that authorities will not need to borrow to cover current expenses. This is good news for bond investors, as the risk of a meltdown in bond prices has been vastly reduced.

We are also witnessing similar things in Europe. In the Eurozone a mixture of political sobriety and economic healing lays the foundations for sustainable government finances. The Eurozone will probably have a primary surplus this year. The problem is that there are 18 different nations, all of which ostensibly take care of themselves. Luckily they are bound together in a common destiny via the European Central Bank, which has deep pockets and is ready to intervene in sovereign debt markets should spreads again threaten the currency union.

Of the larger economies, only Japan might be in serious trouble. The public sector debt is very high. Even with very low interest rates, the interest rate payments are gobbling up much of the state's expenditure. Although the economy has started growing again, there is no primary surplus on the horizon. Public expenditure grows almost as fast as tax bases. Don't lend your fountain pen to Shinzo Abe.

24 SKAGEN FUNDS ANNUAL REPORT | 2013

SKAGEN Global Portfolio Managers Kristian Falnes, Søren Milo Christensen and Chris-Tommy Simonsen

Absolute strength

2013 was a good year for SKAGEN Global in absolute terms; it gained 18.1 percent in GBP. However, we are not satisfied that the world index outperformed the fund by 2.5 percentage points.

Absolute strength

2013 is the third year since the fund was launched in 1997 that SKAGEN Global has ended up with weaker returns than its benchmark index.

The fact that 31 percent of the fund's assets were invested in the world's emerging markets at the end of the year – twice the amount in the benchmark – explains the underperformance.

While the MSCI World Index gained 20.5 percent in 2013, the MSCI EM Index was down 4.4 percent, as measured in GBP. Given this historically wide gap and our weighting in emerging markets, we are satisfied with our company picks.

The fund's return was spread evenly throughout the year, also between sectors and companies. More than half of the companies gained more than 30 percent.

It is reassuring to note that the portfolio is priced at a c. 50 percent discount relative to the world index, both in terms of companies' earnings and book equity.

Developed markets more expensive

Much of the performance in the developed

stock markets can be explained by the fact that companies have become more expensive, in the form of higher earnings multiples (P/E). Only a small part of the share price increase is due to higher earnings. We saw the reverse picture in emerging markets (See the general portfolio manager's report on pages 21-22).

Towards the end of the year, the fund price reached a new all time high. In other words all the fund's unit holders made a profit on their units.

SKAGEN Global's long-term return history is still good, both in absolute and relative terms. Unit holders who have been with us from the start have enjoyed an average annual return of 17.1 percent, versus 4.3 percent for the world index.

Almost as cheap

Despite the fact that the fund price was up 18.1 percent in 2013, companies' P/E multiples were only marginally higher at the end of the year than at the start. This is due to the fact that throughout the year we have sold or reduced holdings in companies with the highest valuations and taken on board lower priced companies with greater share price potential.

The companies' expected earnings growth in 2014 is just over ten percent, which is also in line with the figure a year ago.

Gazprom unappreciated

The oil price was relatively stable at around USD 105-110 per barrel throughout the year. Our energy stocks were up 25 percent, in line with the US oil service index. Baker Hughes and Weatherford were the best contributors here.

Gazprom's share price performance was rather disappointing in 2013. We believe that concerns over lower gas prices in Europe are exaggerated. Contrary to what most people predicted, gas prices in Europe remained at a high level and Gazprom's earnings outlook improved considerably during the second half of the year.

Our solar energy shares, newcomers REC Silicon and REC Solar, both experienced a formidable rise in share

Above average: The commodities sector contributed above-average returns in 2013. The Brazilian mining company Vale was one of the newcomers in SKAGEN Global.

price. This contributed nicely to the sector's returns.

We doubled our position in Russian Surgutneftegas, which we consider to be significantly undervalued. French energy company Technip was new to the portfolio while Nabor Industries and Noble were sold out.

Good contribution from commodities

In contrast to 2012, the contribution from the commodities sector was above the portfolio average. Newcomers included the Korean chemical company OCI and Brazilian mining company Vale. On the strength of our faith in improved trade conditions, we doubled our holdings in Lundin Mining and Norsk Hydro.

After Tyco International was split into three entities in 2012, we exited one of the spin-offs, Pentair, and reduced our holding in ADT Corp. We have maintained our position in the parent company, Tyco International, which was one of the fund's best contributors in 2013. Following a significant share price increase for two subcontractors to the auto industry, TE Connectivity and TRW Automotive, both companies were sold out of the portfolio at a good profit.

Our car manufacturers, Renault, GM, Toyota Industries and Hyundai Motors all drove onto the fund's winners list. These companies were the main reason that the consumer discretionary sector was the fund's single best sector, with a return of over 60 percent. Another good contributor was Russian media company, CTC Media, which experienced a value increase of over 80 percent.

Broad scepticism towards the stock markets in both Brazil and India provided us with the opportunity to buy shares at very attractive prices in the Brazilian residential construction company Gafisa and Indian Tata Motors.

Down in consumption and health

Now that companies with stable earnings have become overly popular

and the price of future earnings is still too high for our liking, we have exited US pharmaceuticals company, Pfizer, and Swedish consumer goods company, SCA. Both companies have been part of our portfolio for a number of years, and made significant contributions to the fund's return.

In 2014 it will be a challenge to identify defensive stocks with an attractive valuation which give good downside protection in a climate of potentially higher bond yields.

In banking we were well rewarded for our stakes in US Citigroup, AIG and Goldman Sachs, as we were in 2012. Our financial stocks in emerging markets did less well, however, and Banrisul, State Bank of India, Sabanci and Bank Asya/ Albaraka all ended up on our losers' list.

We bought into Nordea Bank in connection with the Swedish state selling the entirety of their stake. We found the price attractive, given the expectations of higher return on equity going forward.

Large loss on Irish subsidiary

We sold the remainder of our Gjensidige stake as the stock approached its price target and contributed significantly to last year's results. We doubled our holding in RSA Insurance Group while Norwegian life insurance company, Storebrand, was a newcomer in the portfolio.

RSA Insurance Group has so far been a big disappointment. This is primarily due to a large loss by its Irish subsidiary. The company had to adjust expected future earnings downwards several times during the autumn. The management was compelled to step down and we must prepare ourselves for a significant cut in dividend.

RSA Insurance Group is now a potential takeover candidate, particularly for those companies looking for a position in the attractive Scandinavian market for nonlife insurance.

Our German property company, GSW Immobilien, was taken over by its competitor, Deutsche Wohnen. We deemed the terms of the acquisition to be acceptable and expect the merged company to make cost synergies which will benefit all the shareholders. When it comes to the German property market in general and Berlin in particular, we see good reasons why the recent good share price development should continue.

Swollen coffers

Samsung Electronics experienced strong earnings growth of 25 percent. However, the stock only rose 20 percent, measured in local currency. In other words, this was yet another year when the valuation of Samsung Electronics was lower than its current earnings.

Our preference shares are now priced in line with book equity. Despite increasingly swollen coffers, Samsung Electronics still has a return on equity of around 20 percent a year. A more investor-friendly dividend policy may make the company more popular among investors, which would in turn lead to a welcome repricing of the shares.

One company that was reappraised by investors was Microsoft. The stock market giant was up more than 35 percent last year. While the pricing of Microsoft in recent years has been influenced by fears of how far PC sales could fall globally, the focus has now shifted to Microsoft's attractive position within software for the corporate market.

A change in management and a more effective capital structure through increased dividends and share buybacks also contributed to the lift in the Microsoft share price.

We decided to halve our position in the US software company Oracle as a result of a higher P/E as well as the risk that clients will go over to more web-based solutions.

Ascent with Kinnevik and Vivendi

Our exposure to Russian telecommunication, through our investments in Vimpelcom and Sistema, paid off in 2013. The increase in the popularity of these companies' shares is mainly down to their willingness to pay higher dividends.

Swedish Kinnevik, most of whose value is linked to mobile telephony, was the unmistakable winner within the telecommunications sector. The share price rose 113 percent. Much of this value increase can be attributed to the company's initiatives in online trade portals. Kinnevik's price tag is becoming harder to justify, however, so we more than halved our holding.

Our investment hypothesis that French Vivendi would change its corporate structure has borne out. The share price was significantly up while the conglomerate discount fell to such a level that we decided to exit the company.

We have maintained a minor position in the laggard from 2012, Brazilian Eletrobras. The company still has capital reserves to be able to maintain its dividend obligations linked to the preference capital we own. The share price at the turn of the year reflected a direct return from expected dividends of 14 percent.

No warning light

Although the valuation of several countries' stock markets has risen to levels approaching the historical average, the warning light is not yet flashing. The key here is the earnings development in companies going forward. Most of the juice has been squeezed out of the cost-cutting lemon.

A continued improvement in the world economy should eventually have a positive impact on the top line by way of increased sales. While falling risk premiums was the main driver behind share price developments in 2013, we expect earnings growth to be most influential in 2014.

The 35 largest investments in SKAGEN Global, corresponding to around 64 percent of the fund, are priced at 8.6 times expected earnings in 2014 and are only marginally higher than book equity. This should limit the downside risk while the potential for continued good share price development remains firmly in place. A discount of 50 percent relative to the world index should also lead to better relative performance ahead.

While 2013 was characterised by historically low fluctuations in share price, we must be prepared for greater volatility in 2014 (see the general portfolio manager's report for more on this).

28 SKAGEN FUNDS ANNUAL REPORT | 2013

SKAGEN Kon-Tiki Portfolio managers Kristoffer Stensrud, Knut Harald Nilsson, Cathrine Gether, Erik Landgraff and Hilde Jenssen

Investment philosophy weathers a turbulent year in emerging markets

SKAGEN Kon-Tiki had a strong 2013 in a turbulent year for emerging markets (EM). The fund was up 7.7 percent, compared with a fall of 4.4 percent for the benchmark index as measured in GBP.

Slowing growth, political unrest, and falling currencies all contributed to a weak year for equity investors in EM relative to developed markets. The former were down 4.4 percent as measured in GBP while developed markets were up 20.5 percent. However, despite a number of macro events dominating the news flow out of EM, company specific developments mattered more to returns in 2013 than we have seen for quite some time. In this environment our investment philosophy paid off as we outperformed the benchmark by over 12 percent.

We are pleased to note that many of our core holdings not only benefitted from continued consumption growth in their home regions, but also from a strengthening of their global positioning across both developed and emerging markets. Companies such as Hyundai Motor and Samsung Electronics are formidable competitors irrespective of geography.

We maintain our relentless focus on finding undervalued companies, and Kon-Tiki's portfolio remains attractively valued, trading at a P/E of 5.9 for 2014e and P/B of 1.2, compared with 10.8 and 1.5 for the EM index. While we cannot predict short-term performance, such valuations tend to produce very satisfactory returns for patient investors in the longer term.

Tapering concerns and political unrest

Emerging markets stock markets began the year in flattish to gradually declining territory, before suffering a significant drop in late May. Concerns over the Fed's tapering plans led to large flows from perceived riskier assets such as EM equities, bonds and currencies to so-called safer havens in the developed world. The weakening of currencies exacerbated the fall in equity prices, bringing several large EM stock markets into bear market territory. Markets recovered somewhat in the autumn, but the EM index still finished the year with a seven percent decline.

2013 saw its share of political unrest in several emerging markets. The Taksim Gezi Park demonstrations in Turkey showcased the large divide between an increasingly authoritarian and conservative prime minister and a younger, more progressive part of the population. Turkey finished the year with more turbulence, when a number of high-profile arrests highlighted what appears to be a power struggle between key fractions in Turkish society. Also in Brazil and Thailand, discontent with the ruling class triggered widespread demonstrations during the year.

A year of divergence

2013 was a year of divergence in emerging markets. This trend is not surprising, as the countries grouped into the EM category differ significantly when it comes to the challenges and opportunities they face.

The BRICS had a rough year. Stock markets in Brazil, Russia, India, China and South Africa fell between 3 and 28 percent, as measured in GBP. Growth has generally been disappointing and there are concerns that lack of political and economic reform will make it difficult for several of these countries to return to previous growth rates.

Several ASEAN* region stock markets were also poor performers in 2013. The combination of high valuations at the beginning of the year and significant current account deficits, for example in

Solar energy: Our selection of solar energy companies benefitted from the fact that the market is finally beginning to open its eyes to the sector. Chinese Yingli Green Energy is one of several solar energy companies in the portfolio.

Indonesia, was a rather toxic mix.

Despite poor overall performance in EM, Frontier Markets had a strong year and markets such as Nigeria, Ghana, Kenya and Vietnam all finished the year significantly higher than they started.

From Korea with Love

The largest contributors to returns this year were Hyundai Motor, Great Wall Motor, and Samsung Electronics. We are pleased to see that high conviction ideas, sized accordingly in the portfolio at the beginning of the year, paid off.

In Hyundai Motor, our preference shares (+70 percent) significantly outperformed the ordinary shares (+8 percent), confirming our thesis that the slight disadvantage of lower liquidity that comes with holding preference shares in no way warrants a discount of 50 or even 70 percent. Combine this with an eye-opening valuation of less than three times earnings for a high quality company, and it is clear that the foundations for a good investment were – and are – in place.

Great Wall Motor (+81 percent) continued to grow strongly, benefitting from its excellent position in the fastgrowing SUV segment. Supported by large-scale and low cost manufacturing in China, as well as increasing technological sophistication, Great Wall has a good chance of succeeding in export markets. During 2013, our investment in Great Wall Motor also benefitted from a re-rating of its shares.

Samsung Electronics continued its success in the smartphone market, remains attractively valued, and continues to make its presence felt in a number of other segments and industries. Just as with Hyundai Motor, we hold Samsung's preference shares (+19 percent), which handsomely outperformed the ordinary shares by almost 30 percent.

Perception changes

New positions initiated just before or during 2013 also performed well. In

Kinnevik, our thesis that the company's attractive assets in e-commerce and other online services were not fully priced into the shares has played out nicely thus far. A Swedish company that was established in 1936 and has developed into a leading player in the online industry is a good illustration of how it can take time for perceptions to change. Our investment in Naspers, which delivered excellent returns in 2013 (+99 percent), is another similar example.

Our basket of solar companies, led by Yingli Green Energy and REC, benefitted from the market's realisation that solar energy is now at grid parity without subsidies in several markets. Clearly this has significant implications for demand. Further, the market backdrop for investing in solar is interesting. After many years of red ink, bankruptcies, and disappointing returns for investors, expectations for the sector were very low.

Sistema – our Russian holding company – was an excellent contributor in 2013 as the company proved its ability to generate and distribute returns to investors, in part by focusing its portfolio. AP Møller-Maersk also performed strongly, as the world's leading container ship operator proved its cost leadership in a market which is suffering from temporary overcapacity. The company also pleased investors by focusing its portfolio on key business areas.

Lessons learned

Among our losers, we find companies such as Indonesian telecom operator Indosat, State Bank of India, Brazilian iron ore company Vale, and Turkish conglomerate Sabanci Holding. There is no single explanation for these missteps, but weak earnings and currency developments or worsening investor perception of the country or sector the companies operate in, were common drivers. We believe most of the losses to be temporary, as operational trends and investor perceptions change.

However, a lesson learned is to be more careful with inherently unpredictable business models. We have therefore reduced our exposure to companies whose earnings are heavily influenced by government regulation or the direction of raw material prices. The same goes for companies with too many moving parts, where we are unable to develop high conviction about the overall prospects of the business. During the year we sold out of a number of such companies, and redeployed the funds to higher conviction ideas.

While we achieved good relative performance, we are not satisfied with our absolute return. Our focus is EM, but in hindsight we should have taken greater advantage of our flexible mandate to capture strong equity returns in the US, Europe and Japan.

We stick to what we know

Emerging markets have not been kind to investors over the past three years. While investors have had a tendency to reward high exposure to fast growing emerging markets, we have recently seen an inverse development. Slowing growth and deteriorating investor perception have turned EM premiums into EM discounts, and companies based in emerging markets are now rewarded for exposure to developed markets.

A much debated question is whether emerging markets are currently cheap. Moderate valuation levels both relative to history and to developed markets indicate that patient investors can expect good returns in the longer term.

However, average valuation metrics do not tell the full story in EM. First, companies with large exposure to raw material prices, or those dominated by state ownership, make up a large share of the total market capitalisation. In general, these companies are – and should be – trading at lower valuations. Higher quality private names, on the other hand, trade at significantly higher multiples.

Second, falling margins and high investment levels have caused return on equity in EM to converge toward DM levels, which naturally results in lower valuations. But this is also a source of opportunity. Reduced capital inflows should moderate investment, which together with stabilising currencies could provide support to returns going forward.

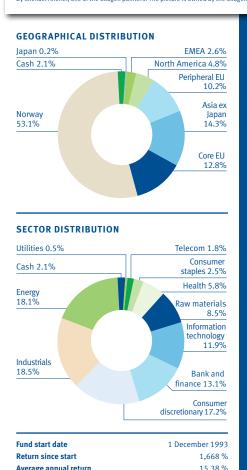

In SKAGEN Kon-Tiki we follow such developments with interest in order to understand the context in which our companies operate. However, predictions in the field of economic growth rates or outcomes of political elections are neither our focus nor our strength. Rather, we continue to look for excellent companies – those with a sustainable edge versus their competitors – and buy them when they trade at a discount to conservatively estimated intrinsic value.

SKAGEN Vekst Handpicked for you Children and young women picking flowers in a field north of Skagen. 1887. Utsnitt. By Michael Ancher, one of the Skagen painters. The picture is owned by the Skagens Museum.

Portfolio Managers' report SKAGEN Vekst

- Re-adjustment and reduction of companies in the portfolio is starting to yield results
- > We expect volatility to be less in SKAGEN Vekst than in the market.
- > We expect the upturn to continue. We are entering 2014 with wellpositioned companies with low valuations. This should form the basis for good absolute returns.

32 SKAGEN FUNDS ANNUAL REPORT | 2013

SKAGEN Vekst Portfolio Managers Geir Tjetland and Ole Søeberg.

Solid low risk year

2013 was a prosperous year for unit holders and a number of companies in the portfolio delivered good results.

SKAGEN Vekst delivered an absolute return of 12.5 percent for 2013. That was somewhat less than our benchmark index which rose 15.8 percent, measured in GBP.

There are a number of good companies on the Oslo Stock Exchange whose share prices have demonstrated above average volatility in the past. We can also expect to see the same in future. This is why, on the whole, the Oslo Stock Exchange tends to fluctuate more than many other stock exchanges.

Nevertheless, the risk in SKAGEN Vekst was lower than in the general market throughout 2013. This reflects our investment philosophy which focuses on absolute returns in individual companies with a low valuation.

SKAGEN Vekst had little exposure to US companies and minimal exposure to Japanese companies in 2013. The more than 20 percent rise in these markets was a large part of the reason that the fund underperformed the index. We underestimated the effect of Abenomics i.e. a substantial rerating of Japanese companies as a result of a more expansive economic policy and a weakening of the yen increased their competitive advantage.

Markets were less correlated than in previous years, both in general and at a company level. The performance of individual companies had more impact on stock prices than in previous years. Positive surprises and disappointments were more clearly reflected in share prices and more attention was given to the attributes and valuations of individual companies. There are good opportunities in place for us as investors and with a well constructed portfolio going into 2014, we look forward to making the most of these in the coming years.

Good contribution

The best contributor of the year was Continental. The share price of the German company rose substantially as investors came to understand that the company is far more than a tyre producer. This realisation was part of our investment thesis. Having increased by 82 percent, the company's share price has now reached a more normal level relative to its earnings potential, but we still see further upside in the share price. For further information, see the separate article about Continental on page 16.

Royal Caribbean Cruises was another important contributor in the portfolio. As we have previously mentioned, the order book of new cruise ships in the past few years is at record low levels. Higher ticket prices, increased consumption on board and good cost control all bode well for the cruise industry in general and for RCL in particular which has not faced the same operational challenges as its competitor, Carnival. If you add to this the expected travel activity of many millions of Chinese wanting to go out and explore the world, then the future looks quite rosy for large parts of the travel industry.

Samsung Electronics was once again a positive contributor to the portfolio in 2013 and the valuation multiple is lower than ever at the start of 2014. At the time of writing the preference shares are priced at 5 times 2013 earnings and 4.7 times 2014 earnings.

It is hard to find a company of the same calibre or size with a lower share price. Samsung Electronics has performed admirably since the company entered

Best contributor: The German car and tyre manufacturer Continental was the best contributor to SKAGEN Vekst in 2013. The company's share price rose substantially as investors came to understand the company's operations.

the portfolio before Christmas in 1997. Based on key figures, the share price has been cheap all along and its price increase has been a result of growing earnings per share. The company will continue to be a large part of the SKAGEN Vekst portfolio in the coming year.

Good things come in small packages

Among the smaller companies in the portfolio we find a number of investments that have made a significant contribution but, due to a much lower total exposure, have received far less attention. The best example of this is Hexagon Composites.

The share price of this company increased mainly thanks to expectations of what is commonly known as the 'gasification' of trucks in the US. Lincoln, a company wholly owned by Hexagon, is the leading manufacturer of gas tanks for trucks in the US. Given low gas prices and, most importantly, the distribution network which now makes it possible to drive from coast to coast in the US on gas, we expect to see an exponential growth in this market going forward. The share price rose over 600 percent in 2013 and contributed GBP 8 million in absolute return to the fund.

Another smaller company in the portfolio is DNO, an Oslo-based oil company. The majority of the company's value comes from a 55 percent ownership in the Tawke field in Kurdistan. SKAGEN Vekst bought into DNO in February with expectations of a repricing based on improving export conditions for oil out of Kurdistan via Turkey. The expectations were fulfilled towards the end of 2013, at the same time as there was a positive development in the assumed reserves in the Tawke field. At the end of the year we assessed that the stock's risk-reward ratio had diminished after a substantial increase for the share price. We also did not feel we were getting sufficient compensation for the political risk in Kurdistan. We therefore chose to take home some of the gains after an upturn of well over 100 percent.

Renewable Energy Corporation (REC) must also be mentioned as another extraordinary contributor in 2013. Admittedly there was no significant increase in the price of silicon, but thanks to restructuring, the spin-off of the REC Solar division and a strengthening of the balance sheet, both REC companies saw their share price develop solidly throughout the year. For more information, see the article on REC Solar on page 13.

The other side of the coin

The companies that detracted from the fund's return include Agrinos, Marine Accurate Well and EMGS. These three companies cost the portfolio GBP 2.6 million each. Common to all three companies are new products/solutions and relatively unproven business models.

Several companies that achieved positive returns but nonetheless contributed to the fund's underperformance include Norsk Hydro, Teva Pharmaceutical, Statoil, RSA Insurance, SAP, Kongsberg Gruppen and the Olsen twins, Bonheur and Ganger Rolf.

We increased our exposure to Norsk Hydro at the end of last year when Vale was sold out of the company. Norsk Hydro has an extremely low price tag, but is not earning any money. It is difficult to predict when aluminium prices will rise, but we know that Norsk Hydro is extremely competent from an operational perspective and is best in class when it comes to costs. In addition the company has considerable power production assets.

We also added to our position in Statoil in December. Statoil, like other oil majors, is increasing its focus on value creation, which will result in lower investments and improved cash flows and dividend potential. This is not reflected in the current pricing of the large oil companies, Statoil included.

Our holding in the pharmaceutical company, Teva, was also increased in December. The company is incredibly cheap despite an expected decline in income from the sclerosis drug, Copaxone, during 2014. The company also has a new CEO after much unrest recently. This will hopefully give Teva the peace it needs to develop further at the same time as it substantially cuts costs.

The insurance company Royal Sun Alliance faced its fair share of challenges last year, particularly the company's Irish arm, which incurred large losses for the company. A recent report from PwC confirmed that the cockroaches found in the Irish kitchen had not spread to the other countries in which RSA operates.

Expanded mandate

2014 promises to be an exciting year for SKAGEN Vekst. First and foremost because we have changed our investment mandate from 50/50 Norway/Global to 50/50 Nordics/Global. This will give us access to a broader investment universe, and not least, reduce the portfolio's exposure to the oil and energy sector. Going into 2014, SKAGEN Vekst has just over 50 percent of the portfolio invested in Norwegian companies. This will be reduced gradually as we identify companies that are of sufficient quality and cheap enough to replace existing holdings.

For unit holders it is also good news that SKAGEN Vekst has from the start of the year introduced a high watermark, and thereby improved its fee structure in our clients' favour.

For 2014 we expect that our companies will deliver earnings of over 20 percent and believe that this will be reflected in higher share prices. Current expectations for growth in the global economy are becoming more positive, which is good news for cyclical stocks. Higher growth can be a risk since bond yields will rise in the long term and the attractiveness of equities will fall in line with this. Such a scenario may be reminiscent of the situation 20 years ago, when equities rose significantly in 1993 while the return in 1994 was moderate, despite much better company earnings.

At the start of the year, the SKAGEN Vekst portfolio is priced at just over 11 times last year's earnings. Measured on expected earnings in companies in 2014, the portfolio is priced at just under 9 times earnings. The difference in numbers reflects the fact that we expect strong earnings growth. We are satisfied with these levels.

By way of comparison our benchmark index is priced at 14 times earnings in 2014. Although the general stock market can no longer be perceived as cheap, but rather normally priced, we are optimistic about the coming year.

Portfolio Managers' report SKAGEN m²

- The fund was affected by major fluctuations in the demand for real estate equities as well as macro unrest in the Asian markets.
- > British real estate stocks, a couple of US REITs and Olav Thon were a few of the winners in the portfolio in 2013.
- Global growth should slowly increase in 2014, and this will have a positive impact on real estate equities.

36 SKAGEN FUNDS ANNUAL REPORT | 2013

SKAGEN m² Portfolio Managers Harald Haukås, Michael Gobitschek and Peter Almström

Roller coaster ride for global real estate equities

In order for listed real estate companies to deliver shareholder returns closer to real estate than equity, a long investment horizon is a requisite – preferably five years or longer. In other words, patience is called for but the developments in 2013 really put this patience to the test.

Up until 21 May 2013, the fund's return was over 20 percent, measured in GBP. At that point, real estate shares fell sharply and the entire upswing evaporated in one month. The fund ended the year down 6.0 percent compared to a gain of 0.8 percent for our global benchmark index.

Downward spiral

These swings were related to central banks' handling of the global financial crisis. Extremely low interest rates increased demand for high-yield assets such as real estate and real estate shares. The exceptionally low interest rate levels in the United States and Japan also created the conditions for so-called carry trades whereby investors borrowed large amounts in low-interest foreign currencies, in order to invest in high-yield securities in other countries, such as Southeast Asia. The consequence was that real estate shares were valued higher relative to their earnings; a so-called multiple expansion. We were aware of this but underestimated the impact on markets outside the US, Japan and Hong Kong.

When the US Federal Reserve published

its plans to withdraw its intervention purchases of bonds on 22 May, demand for real estate shares quickly dropped particularly among investors sensitive to interest rates such as bond investors and those performing carry trades. When real estate shares failed to recover quickly, fund investors started to move money out of long-term real estate equity funds, which were then forced to sell shares to handle the negative fund flow. Alongside this, there was outflow of capital from multiple emerging markets due to macro concerns, especially for countries like India and Indonesia with major current account deficits.

SKAGEN m2 was directly affected by the downturn in the global real estate equity market, but compared to our benchmark index we were much more affected by the downturn in the Asian emerging markets, primarily Indonesia but also Thailand, India and the Philippines. In 2013, SKAGEN m2 had an average total exposure of around 50 percent to emerging markets, compared to less than 10 percent for our benchmark index.

One of SKAGEN m2's fundamental

ideas is to combine SKAGEN's proven value-based investment philosophy with thematic real estate investment strategies. One such theme is valuecreating real estate companies in strong metropolitan areas - not countries - where economic growth is faster as a result of urbanisation, the accumulation of skills and growing prosperity. Another theme is the development of e-trade and its effect on bricks-and-mortar retail centres and logistics systems. However, in 2013 returns were dominated by global, crossborder equity market trends. Geography and foreign exchange rates also played a large part in the total outcome, while company and segment-specific differences in earnings and valuation of future cash flows had relatively less impact. In 2013, our best returns on our investments came from Europe and the US, and most of our losses were incurred in Southeast Asia and Brazil.

Strong US portfolio; chose to stay out of Japan

The three best geographic real estate equity markets in 2013 were Japan,

UK property: British Segro and British Land were two of the winners in the portfolio in 2013. The best returns came from Europe and the US last year, while South East Asia and Brazil disap-

the UK and Sweden. Japanese real estate shares outperformed the broad equity index in Japan by 10 percent and contributed significantly to the returns in our benchmark index. Powerful stimulatory measures by the Bank of Japan weakened the Japanese yen and created negative real interest rates, which prompted a very strong rally in shares. We chose not to invest in Japan because it seemed expensive even before the rally, and the fundamentals for Japan look weak. In 2013, this cost us roughly 4 percent in negative returns relative to our benchmark. We have indirect exposure to logistics properties and nursing home facilities in Japan via two Singapore-based companies - Global Logistic Properties and Parkway REIT whose operational performance was stable throughout the year.

The British company Segro and British Land were among the winners in the portfolio during the year, but we have

reduced our exposure slightly because of high valuations. In Sweden, our holdings in Sagax and Balder performed well at the start of the year but, with the benefit of hindsight, we sold too early when both stocks exceeded our price targets in the spring.

The worst real estate equity markets for the year were Turkey, India and Brazil - all down around 40 percent. Indonesia had the biggest price fluctuations of the year, with a peak of 73 percent and a final figure for the year near zero. Additionally, the foreign exchange rate declined by 20 percent. Towards the end of the year, relative returns worsened due to the increasing political unrest in Thailand and Turkey.

US real estate investment trusts (REITs) generated negative returns in 2013; more than 30 percent lower than the S&P 500 in USD. We did well in our share picks in the US, with four of our ten holdings there

rising between 15 and 20 percent in USD. The hotel company Ashford and SL Green with offices in Manhattan were on the portfolio's top-10 list.

In China, we were successful despite a weak market and two of our holdings -SOHO China and Shimao – were among the best Chinese real estate shares on the Hong Kong Stock Exchange.

In India, the price performance of DLF was sharply negative in spite of higher earnings and large surplus values, while both Indiabulls and Phoenix Mills outperformed the local real estate equity index for the year. In Brazil, all our holdings exhibited good underlying performance but the stock market deteriorated significantly over the year as the Brazilian Central Bank was forced to implement major new interest rate hikes, in order to curb rising inflation. Along with India and Turkey, Brazil is the country where the government's actions did the most

economic damage in 2013, with sharp price declines despite fundamentally good conditions and good earnings on our investments.

Stronger growth in sight

In Indonesia, we performed very well in the spring, and it was a mistake not to take home a lot more profit when we had the opportunity in April and May. We had strong inflows into the fund during that period, while almost all real estate shares - low-risk companies in particular - rose sharply in a short time. It was not easy to decide where to move profits from a valuation perspective. We have tightened our procedures for gradual repatriation of profits and geographic risk management, and we will be able to handle similar market developments significantly better in the future.

In recent years, REITs have attracted more investors but they have also become more volatile in step with increased uncertainty about future interest rate levels. We have therefore actively reduced our share of REITs and instead sharpened our portfolio focus on what we call valuecreating real estate companies where a major part of current earnings are actively reinvested in the development of the business.

Going into 2014, we note that property stocks in most mature markets have become more expensive relative to earnings (except for the US), while most emerging markets have become more affordable. There is much to suggest slowly improving global growth in 2014, which will also benefit real estate shares.

Historically, real estate shares have often declined initially in connection with a rise in interest rates, but then quickly rebounded either as a result of higher economic growth or rising inflation. In the US, we have seen both higher interest rates and higher growth, which may indicate cautiously positive market conditions for real estate companies especially as interest rates can be expected to remain at historically attractive low levels. The valuations of several US REITs are more attractive today than before, and we have gradually increased our exposure to the US during the year from about 15 to 20 percent.

In Europe, we expect that France will remain relatively weak in 2014, but with a much stronger property market in Paris. In the UK, there is a risk of rising lending rates, but good value creators may still perform strongly. The housing market in the UK is still being supported by continued favourable financing and strong demand in London from foreign investors. German housing, especially in Berlin, remains interesting. In Sweden the underlying market conditions in metropolitan areas, primarily in Stockholm, seem strong but listed real estate shares appear expensive, especially if market interest rates start climbing in the long term.

Value front and centre

In markets such as Indonesia, Thailand, Brazil and India many of the negative scenarios for real estate shares have already been priced in. However, we should probably expect that the negative market sentiment will persist a while longer, at least until we get more clarity about the election outcomes in these countries. In China, we believe that many local real estate markets will continue to grow rapidly and within underdeveloped real estate segments, such as logistics. We also expect that the already implemented tightening in China will continue to slow down the unsustainable price increases we have seen in the past, which in this case is positive. At the same time, ongoing reforms and deregulation might be beneficial to the long-term development of many cities and submarkets.

The pricing of Japanese real estate shares requires very strong growth or constantly negative real interest rates, and we do not believe in either of these scenarios. But there is a lot of capital in Japan in bank accounts or bonds that should be moved into equities. Tokyo is growing, as is the need for care for the elderly, and there are opportunities for skilled management teams to create good real estate returns also in Japan.

With our long-term focus on value shares, the fundamental driving forces remain in place and in light of

Portfolio Managers' report **SKAGEN Tellus**

- > We were rewarded for staying away from long US and German bonds.
- > We believe interest rates will continue to remain low in 2014, despite global growth expectations.
- > There should be good opportunities to make profits in 2014 in the market for government bonds.

HISTORIC PRICE DEVELOPMENT (IN GBP)

SKAGEN Tellus Portfolio Manager Torgeir Høien

A year of opportunities

Risk free interest rates rose in 2013. SKAGEN Tellus profited from this relative to its benchmark index as we stayed away from long US and German bonds and the like. So what do we expect in 2014?

We believe that global economic growth will be better than most analysts expect. Nevertheless we think long risk-free interest rates will remain quite stable. How come? Doesn't growth push up risk-free interest rates?

We believe that the fixed income market has already priced in relatively brisk economic growth in 2014. That is the reason why the interest rate on a US 10-year treasury bond rose from around 1.6 percent at the beginning of 2013 to around 3 percent at the start of 2014.

We also take the central bankers at their word when they say that short interest rates will remain low for several years to come. The latest signals from the US indicate that the Fed is not inclined to raise the policy rate before 2017. And the European Central Bank is probably going to be a laggard. Why not raise policy rates faster? Because unemployment is high and inflation is lower than the central bank objectives. In the Eurozone unemployment was 12.1 percent in December and core inflation fell to 0.7 percent.

Our view also differs when it comes to how we regard the effects of a period of near zero interest rate policies. Almost everyone says that zero interest rates eventually pull up inflation. But it may be that they are wrong. What if a zero interest rate policy results in lower rather than higher inflation? Arguably this is what happened in Japan. The Bank of Japan has held the interest rate at around zero for years now, and until recently they had almost continuous deflation.

There are two paths from low interest rates to low inflation. Over time expected inflation is equal to the difference between the nominal interest rate and real interest rate. Central banks cannot control the real rate in the long term. When economic growth pushes up the real rate, expected inflation will fall for a given nominal interest rate. Also, zero interest rate policy has an effect on fiscal policy. Low interest rates lead to lower coupons on government bonds. This implies a decline in public expenditures. It is this that has enabled Japanese authorities to finance their debt. Thanks to the Bank of Japan, the average coupon on Japanese government bonds is only 1.2 percent.

So while the real interest rates might increase somewhat throughout the year, we expect falling inflation and lower inflation expectations to keep the long nominal interest rates in check.

With reasonable stability in the long risk free interest rates, we see significant opportunities in countries which have a high spread to German and US interest rates - both in the Eurozone and in emerging markets.

Uncertainty is as always greatest with regard to how the exchanges rates will move. 2013 was the year of the euro against all the odds. We do not expect to see a repeat of that in 2014.

GOOD RESULTS ARE NO GUARANTEE FOR FUTURE RETURNS

Historical returns are no guarantee for future returns. Future returns will depend, inter alia, on market developments, the fund manager's skill, the fund's risk profile and management fees. The return may become negative as a result of negative price developments.

Explanation of concepts

All calculations of measurements are based on monthly observations.

Traditional risk and performance measurements

Standard deviation is a measure of the variation of annual returns. There is approximately a 65 percent probability that annual returns will be in the range of plus/minus one standard deviation. The probability that returns will deviate more than two standard deviations from the expected return is approximately five percent. A high standard deviation may indicate high risk.

Sharpe ratio measures the probability of the fund generating a higher return than the risk-free interest rate. The higher the score, the higher the probability. The higher the probabil- ity, the more certain are the chances of achieving excess returns in the equity market. Thus, the value may be used as a long-term measure of risk, but is often used as an absolute measure of risk-adjusted returns.

Relative volatility is the standard deviation of the annual excess return relative to the benchmark during the relevant period. Relative vola-tility measures the manager's ability to create regular excess returns relative to the benchmark, but is often used as a measure of a fund's inde-pendence of the benchmark. Information Ratio measures the probability of the fund generating a higher return than its benchmark. The higher the score, the higher the probability of achieving excess returns. The information ratio is also used as a measure of risk-adjusted excess returns, where risk is con-strued as the chance of uneven excess returns. Thus, the information ratio measures the man-ager's ability to create certain excess returns, whereas relative volatility measures the ability to generate regular excess return.

Alpha is a risk-adjusted measure of the so-called active return on an investment. It is the return in excess of the compensation for the risk borne, and thus commonly used to assess active man- agers' performance. It can be shown that in an efficient market, the expected value of the alpha coefficient is zero. Therefore the alpha coef- ficient indicates how an investment has per- formed after accounting for the risk it involved

An alpha value less than zero means the

investment has provided too little return relative to the given risk (or had too high a risk in terms of yield).

An alpha value of zero means the investment has earned a return adequate for the risk taken. An alpha value of over zero means the invest- ment has a return in excess of the reward for the assumed risk.

Beta of a stock or portfolio is a number describ- ing the relation of its returns with that of the financial market as a whole. An asset with a beta of 0 means that its price is not at all cor- related with the market. A positive beta means that the asset generally follows the market. A negative beta shows that the asset inversely follows the market, if the market goes up, then the asset generally decreases in value and vice versa. Instead of the market in general SKAGEN applies the fund's reference index.

R2 is used in the context of statistical models whose main purpose is the prediction of future outcomes on the basis of other related informa- tion. It is the proportion of variability in a data set that is accounted for by the statistical model. It provides a measure of how well future outcomes are likely to be predicted by the model. A high value (close to 100%) indicates a high and good explanatory power.

Correlation is a measure of relationship between a set of two variables or measurements. A high correlation means that one set of variables can be predicted from the other and vice versa. In this case a high correlation (close to 100%) means that the asset or portfolio follows the market closely.

Value at Risk (VaR) is a widely used risk measure of the risk of loss on a specific portfolio of financial assets. VaR here corresponds to how much you can risk losing in a month with 2.5% probability. Calculations are both parametric and observed figures from the past five years. Given that the observations of the last five years are among the worst in the last 30 years, it is expected that the calculation based on these observations shows a greater loss potential than the parametric cal- culation (based on standard deviation).

The relative VaR is a measure of the worst under performance in a month.

Profit and loss analysis

Relative gain/relative loss is a measure of the ability to achieve excess returns in cyclical upturns and downturns, respectively. A relative loss of 80 percent means that the fund has suf-fered a loss corresponding to the loss it would have suffered if it were invested 80 percent in the benchmark and 20 percent in risk-free securities.

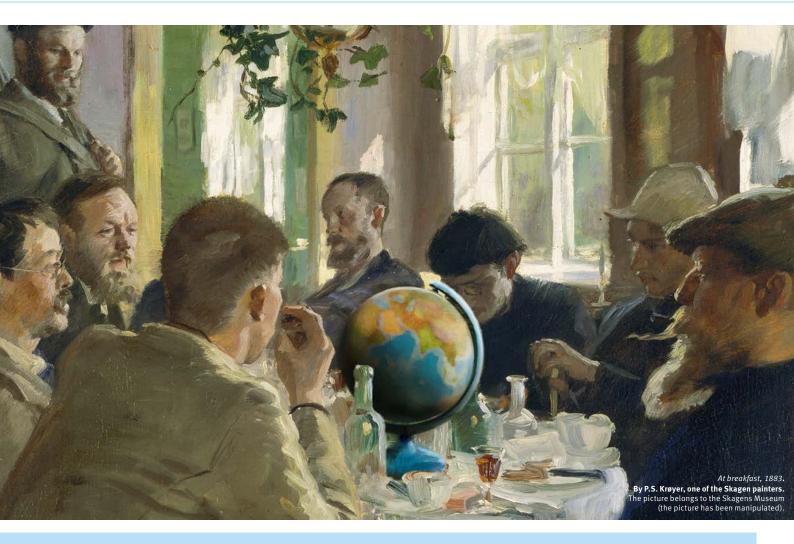

A relative loss of less than 100 percent means that the fund is losing less than the market in a cyclical downturn. A relative gain of more than 100 percent means that the fund is performing better than the market in a cyclical upturn. If you compare with a fund's standard deviation, these measures may explain why the standard devia- tion is higher or lower than the benchmark.

Relative gain/relative loss ratio shows the ratio between relative gain and relative loss. A value above one means that the fund is getting better paid for the risk assumed relative to the bench- mark. When ranking funds investing in the same market, the measure is strongly correlated with the Sharpe ratio, but also shows whether the risk-adjusted return is better than the risk- adjusted return of the market. Thus, the meas- ure may be used to compare funds in different markets, as opposed to the Sharpe ratio, which may only be used to compare funds investing in the same market.

Positive/negative index divergence shows posi-tive or negative annual divergence during the relevant period. If positive divergences are greater than the negative ones, the fund has achieved a higher return than the benchmark. The total of positive and negative divergences is a measure of the fund's independence from the benchmark.

Index divergence ratio shows the ratio between positive and negative benchmark divergences. This is a measure of the ability to create excess returns. The higher the number, the better you get paid for each negative benchmark diver- gence. The benchmark divergence ratio inter- prets risk as the chance of negative index diver- gences, as opposed to the Information Ratio, which construes the risk as irregular excess returns).

THE ELECTION COMMITTEE

The election committee consists of Sigve Erland (Chair) and Mette Lundh Håkestad. The election committee proposes candidates for unit holder representatives for the Board of Directors of SKAGEN AS.

Board of Directors' Report on the funds 2013

For unit holders in SKAGEN's funds, 2013 was one of the least volatile in the company's 20-year history. The gap between developed and emerging markets grew, and this had an impact on the returns of several of our funds.

What happened in 2013?

2013 was a year of greater optimism in which the global economy stabilised. It was also a year without major market corrections, but with a large discrepancy between returns in the various stock markets. The developed stock markets performed well, while performance in emerging markets was unexpectedly weak. This resulted in a large returns gap between developed and emerging markets. Nevertheless, given the weakening of the Norwegian krone, both markets ended up in positive absolute return territory as measured in NOK. The good return from SKA-GEN Kon-Tiki demonstrated that SKAGEN's investment philosophy made it possible to attain good returns even in the unpopular emerging markets.

What can we expect in 2014?

We believe that the global economy will stabilise further and that we will see somewhat stronger growth. It appears as though interest rates will remain low and we expect an improvement in companies' earnings, both as a result of stronger growth and cost focus. Slightly more expensive shares relatively speaking may give rise to more faith and doubt, however, and hence more fluctuations than we saw in 2013.

There are, as always, some concerns, however. We may see a setback in economic growth, interest rates may increase more than expected and there is always some uncertainty around geopolitical developments.

New mandate in SKAGEN Vekst

After more than 20 years, we are expanding the mandate of SKAGEN's oldest fund, SKA-GEN Vekst, from a minimum of 50% investments in Norway to a minimum of 50% in the Nordics as of 1 January 2014. The reason for this change is that over the past 20 years, the Oslo Stock Exchange has become increasingly dominated by energy-related companies, such that the risk profile no longer gives the risk/reward ratio SKAGEN wants. With the expanded mandate, it will be easier to find companies that fulfil the three Us in SKAGEN's investment philosophy. At the same time it was agreed that a so-called high watermark would be introduced to calculate the fund's variable fee, which will mean that unit holders may pay a lower management fee in volatile markets. A high watermark works in such a way that no variable management fee is calculated unless the fund's price is higher than it was at the previous calculation.

Unit classes

SKAGEN uses distributors and advisors in some countries and they receive retrocession for the work they do. In the Netherlands and the UK, regulations have been introduced whereby distributors and advisors in these countries may not receive retrocession for individual client groups. In order to adapt to these regulations, in 2013 SKAGEN laid the groundwork for establishing a so-called clean unit class in its three oldest equity funds from 1 January 2014.

Assets under management

Assets under management increased in 2013 by NOK 18.8 billion (EUR 0.4 billion) from NOK 109.3 billion (EUR 14.9 billion) to NOK 128.1 billion (EUR 15.3 billion). Altogether there were net redemptions of NOK 6.3 billion (EUR 808 million), mainly as a result of Norwegian and global investors reducing their exposure to emerging markets. The value increase was NOK 25.1 billion (EUR 1.2 billion).

SKAGEN has retained its position as the largest independent fund manager in the Norwegian mutual fund industry even though there were net redemptions of NOK 6.1 billion (EUR 777 million) in the equity funds in 2013.

The fixed income funds had net redemptions of NOK 0.3 billion (EUR 44 million), while the balanced fund SKAGEN Balanse had new net subscriptions of NOK 0.1 billion (EUR 13 million).

SKAGEN's markets outside Norway are becoming increasingly more important to the company. As of the end of 2013 Norwegian clients constituted 40% of the total assets under management, other Scandinavian clients 35%, while clients outside Scandinavia accounted for 25%.There were no unusually large redemptions in the equity or fixed income funds in 2013.

Returns in the funds

2013 was another demanding year for value managers and several of SKAGEN's equity funds delivered an unsatisfactory performance in relative terms.

All the funds delivered a good absolute return in 2013 as measured in NOK. SKAGEN Kon-Tiki was the best equity fund in relative terms, with an excess return of 13 percentage points (12 percentage points in EUR terms) relative to its benchmark index, while SKAGEN Global and SKAGEN Vekst underperformed their benchmarks slightly. SKAGEN m² performed relatively weakly throughout its first full year in operation. All of the fixed income funds, as well as the balanced fund of fund, SKAGEN Balanse 60/40, outperformed their benchmark indexes.

Unit holder meetings

The new act on securities funds which entered into force on 1 January 2012 has reinforced unit holder democracy by introducing unit holder meetings as a new decision-making body. Unit holders have been given the authority through unit holder meetings to approve changes to articles of association and the merging of funds, provided that 75 percent of the votes represented at the meeting vote in favour of the change. The Financial Supervisory Authority of Norway shall continue to ensure that the changes are lawful and that the management companies have followed the necessary procedures. According to the new regulations, however, unit hol-

BOARD OF DIRECTORS' REPORT

Martin Gjelsvik Chairman of the Board and owner

Tor Dagfinn Veen Board member and owner

Barbro Johansson Board member, elected by shareholders

Yuhong Jin Hermansen Board member, elected by unit holders

ders will be given the opportunity to assess and vote on which changes they believe are in their interests.

Several unit holder meetings were held in 2013, including one to establish the clean unit classes mentioned above. Arrangements were made to enable advance voting via SKAGEN's webpages in order to ensure that as many people as possible could participate.

Focus on client dialogue

SKAGEN aims to provide clients with the best possible service, follow-up and communication, and strives to be innovative and unique in its client service and communication.

SKAGEN's webpages give a good overview of the funds' performance and prices as well as a news service which provides for direct communication with SKAGEN's employees. Meanwhile the web portal "My Page" provides unit holders with tailor-made information, reports and analysis on their holdings in SKAGEN's funds.

There has been a lot of activity in all of the countries where SKAGEN's funds are marketed. The offices in Norway, Sweden and Denmark have hosted inspiration, lunch and theme meetings, all with good attendance. The office in the Netherlands, which was established in 2011, is making good progress meeting clients in various channels. In the UK, SKAGEN mostly has institutional clients. There are often specific requirements regarding managing assets for this client group, and employees at the London office have spent a lot of time with clients and consultants reviewing SKAGEN's investment philosophy, risk management and internal control. SKAGEN also dedicates substantial resources towards ensuring that distributors in the various countries have sufficient knowledge about SKAGEN's funds and that clients have the correct experience of SKAGEN, even when operating through distributors.

SKAGEN has adapted its webpages for use on tablets and mobile phones. A solution has also been developed for Norwegian clients to trade via mobile phones using BankID. In the Nordic markets social media is becoming an increasingly important communication channel with our clients.

Each year SKAGEN carries out a client survey in Norway and Sweden where we have the highest proportion of direct clients, to evaluate whether the company fulfils its goal of providing the best possible service and follow-up. The 2013 client survey shows that clients are still satisfied with SKAGEN.

SKAGEN's employees

At the end of 2013, SKAGEN has 179 employees divided between six offices in Norway (Stavanger, Trondheim, Ålesund, Bergen, Oslo and Tønsberg), two offices in Sweden (Stockholm and Gothenburg), and one office each in Denmark (Copenhagen), the UK (London) and the Netherlands (Amsterdam). SKAGEN's funds are also marketed in Finland, Switzerland, Luxembourg, Belgium and Iceland.

Employee know-how and competency development is a priority for SKAGEN and our clients. At the end of 2013 nearly all of SKAGEN's client representatives are authorised financial advisors. The program has high requirements for theoretical and practical knowledge, and employees who deal with clients must sit examinations supervised by an independent committee. In Sweden a similar authorisation scheme was introduced in 2005, and all our Swedish advisors are authorised in accordance with it.

During its almost 20 years of business, SKAGEN has had an incentive structure and ownership model that encourages long-term planning and sustainable risk levels. The management company's earnings fluctuate considerably with the markets and it has been essential to keep a low fixed cost base in order to sustain the organisation and maintain competence levels during hard times. In order to be able to recruit and keep the best employees in a global market, SKAGEN must be able to pay a variable income when the company shows strong results.

SKAGEN has a compensation model that is intended to encourage employees to work together to provide clients with the highest possible risk-adjusted returns. The model promotes cooperation between all departments to ensure that clients experience SKAGEN in the best possible way, also with respect to service, competent follow-up and communication. No employees have their salary directly tied to subscription results. Thus we avoid the negative aspects often associated with such arrangements, including unhealthy internal competition and sales pressure, protection of own expertise and poor utilisation of employee resources.

SKAGEN recruits employees with diverse backgrounds, and seeks to achieve a balance between male and female employees. At the end of the year, there were 63 female and 116 male employees. There are equal opportunities for both genders with respect to terms of employment and pay. In 2013, SKAGEN had an absence rate due to illness of 3.4 percent.

The Board of Directors wishes to thank all employees for a great effort in 2013. Employee competence and conduct are decisive to SKAGEN's performance.

Organisation

SKAGEN AS is supervised by the Financial Supervisory Authority of Norway, and is the manager for SKAGEN's funds. Handelsbanken is the funds' custodian and the Norwegian Central Securities Depository (VPS) is the registrar for SKAGEN's registry of unit holders.

Risk management

The Board has approved the funds' risk profile, which shall be reviewed at least annually. The Board receives risk reports at every Board meeting. SKAGEN's funds take a holistic approach to managing market risk, credit risk, liquidity risk, operational and legal risk and reputational risk. Employees responsible

Per Gustav Blom Board member, elected by unit holders

Deputy member, elected by shareholders

Anne Sophie K. Stensrud Deputy member and owner

for risk and compliance work in close cooperation with the various departments, but at the same time remain independent and report directly to the Board.

Financial risk

Martin Gjelsvik

The funds' financial risk is low and only consists of interest rate risk, as they only have short-term debt connected with the settlement of securities.

Market risk, credit risk and liquidity risk

Risk in fund investments arise as a consequence of market movements, developments in currency, interest rates and the economic cycle as well as sector and company specific issues. Throughout 2013 the anticipated risk level at portfolio level was unusually low. The actual risk was in line with expectations, with the exception of the property fund SKAGEN m². Here the risk was actually higher than expected due to a combination of the fund's high exposure to the Asian markets and the weak development and significant turbulence in India, Indonesia and Thailand. The market risk is expected to be somewhat higher in 2014 than in 2013 due to the fact that equities in general have become more expensive relative to value multiples as well as imminent political elections in several important markets. This gives more room for faith and doubt and it may become more unclear what will capture investors' interest and generate risk aversion.

In addition to statutory requirements, SKA-GEN takes different approaches to managing the relevant risk categories. SKAGEN aims to reduce the market risk by diversifying investments between various sector, country and currency types. SKAGEN applies the investment philosophy when analysing a company's valuation, product/market matrix, gearing and the liquidity of the security. Investments in the fixed income funds are made based on an evaluation of the creditworthiness of individual issuers and the general economic and institutional conditions in the country in which the issuer resides. The credit risk is limited by having a minimum requirement regarding creditworthiness and counterparty type. Credit risk in the form of counterparty risk on settlement is reduced by seeking instant delivery versus payment (DVP) as well as surveying broker counterparty quality with regard to creditworthiness and accounts.

Liquidity risk is assessed on a regular basis, among other things by reviewing historically large net redemptions relative to conservative estimates of the potential to sell each security.

Operational risk is followed up and managed

via updated event registers as well as detailed discussions with the company's managing directors in the various market areas. The different contributors to operational risk are then assessed by the managing directors on an aggregate level and potential measures weighed up.

SKAGEN has drawn up internal routines to reduce the risk of operational errors that could have an impact on the funds.

Both legal requirements and internal guidelines have been adhered to in 2013.

The Board confirms that the premise of the management company as a going concern continues to be fulfilled.

Investment philosophy

The Board adheres to SKAGEN's investment philosophy and business concept. We are convinced that the best way to create excess return for clients - currently as previously is to have an active investment philosophy whereby portfolio managers seek unpopular, under-researched and undervalued companies. The same principles apply to the managers of SKAGEN's fixed income funds: the funds will be actively managed on the basis of our own analyses of the markets, issuers and the individual securities.

Proposal for the allocation of funds' income:

General notes 2013

NOTE 1: ACCOUNTING PRINCIPLES

All figures in NOK 1,000 unless otherwise stated.

The accounts for 2013 are prepared in accordance with the Norwegian accounting law and regulation for annual financial statements for securities funds.

Financial instruments:

All financial instruments, such as shares, bonds and certificates, are valued at fair value (market value).

Determination of fair value:

Securities are valued at market prices as of 31.12.2013.

Bonds and notes, for which there are no "marketmaker" prices, are at all times valued against the applicable credit spreads and yield curve.

Unlisted equities are valued according to the latest trading price, value adjustments made by brokers and/or internal valuations.

Currency exchange rates:

Securities and bank deposit/overdraft in foreign currency are valued at the prevailing exchange rate at the time of pricing 31.12.2013.

Treatment of transaction costs:

Transaction costs in the form of commission to brokers is charged to expenses at the time of the transaction.

Allocated to unitholders for reinvestment:

Net taxable income in the fixed income funds, comprised of interest income, realised capital gain/loss and other income with deduction of management fee and transaction related custodian costs, is distributed to the unit holders as the issue of new units as of 31.12.2013.

All distributions to unitholders in fixed income funds are treated as allocations of profit in accordance with the regulation for annual financial statements for securities funds. Distributions from fixed income funds are accounted for by entering reinvestments as new units in the fund in the financial year.

NOTE 2: FINANCIAL DERIVATIVES

The funds have not held financial derivatives during the year.

NOTE 3: FINANCIAL MARKET RISK

Through investment in Norwegian and foreign businesses, the equity funds are exposed to share price, currency exchange and liquidity risks. The fixed income funds are exposed to interest and credit risks, liquidity risks and to currency risks in those cases where the funds invest in currencies other than NOK.

In addition to laws, regulations and articles of association regulating the risks in the funds, the funds are managed with a conscious focus on company-specific risks related to the companies constituting the funds' portfolios.

NOTE 4: CUSTODIAN COST

The funds are only charged transaction related custodian costs

NOTE 5: TURNOVER RATE

The turnover rate is a measure related to the average duration of the investments in the fund.

The turnover rate is calculated as whichever is the smaller amount of either purchases and sales of securities in the portfolio during the year, divided by average assets under managment during the year. The formula is an approach for calculating the funds' turnover rate.

The funds' turnover rate for the year 2013 was:

SKAGEN Vekst	29 %
SKAGEN Global	20 %
SKAGEN Kon Tiki	21 %
SKAGEN m ²	52 %
SKAGEN Balanse 60/40	36 %
SKAGEN Avkastning	68 %
SKAGEN Høyrente	33 %
SKAGEN Høyrente Institusjon	68 %
SKAGEN Tellus	358 %
SKAGEN Krona	116 %

NOTE 6: SUBSCRIPTION FEE

There are no subscription or redemption fees for any of the funds.

NOTE 7:

Refer to pages 57 to 69

SKAGEN Vekst Note 8, 9, 10 & 11

NOTE 8. MANAGEMENT FEE

The fixed management fee constitutes 1 percent p.a. of daily assets under management in addition to the variable management fee: 1/10 of the return above 6 percent p.a.measured in Norwegian kroner.

NOTE 9. EQUITY RECONCILIATION

	Unit capital	Premium	Retained earnings	Total
EQUITY CAPITAL AS OF 1.1.2013	559112	-1588476	8 2 1 1 3 5 4	7 181 990

figures as of 31/12 are used in the annual financial statement. Consequently minor timing differences may occur.

NOTE 10. TAX NOTE

Equity funds are, in principle, exempt from tax on gains and do not have the right to deduct losses on realisation of equities when calculating taxable income. Furthermore, dividends received from companies within the EU/EEA are, in principle, tax-exempt. However, 3 percent of dividends received from these companies are treated as taxable to Norway.

Dividends received from companies outside the EU/EEA are taxable. The funds may in addition be charged withholding tax on dividends received from all foreign companies.

The tax cost for the years 2013 and 2012 in SKAGEN Vekst is associated with withholding tax on foreign dividends.

NOTE 11. RISK AMOUNT (in NOK)

*Base price is set at the end of the last working day of the year and is based on the best prevailing estimate. Finalised figures as of 31/12 are used in the annual financial statement. Consequently minor timing differences may occur.

NOTE 10. TAX NOTE

Equity funds are, in principle, exempt from tax on gains and do not have the right to deduct losses on realisation of equities when calculating taxable income. Furthermore, dividends received from companies within the EU/EEA are, in principle, tax-exempt. However, 3 percent of dividends received from these companies are treated as taxable to Norway.

Dividends received from companies outside the EU/EEA are taxable. The funds may in addition be charged withholding tax on dividends received from all foreign companies.

The tax cost for the years 2013 and 2012 in SKAGEN Global is associated with withholding tax on foreign dividends.

SKAGEN Kon-Tiki Note 8, 9, 10 & 11

NOTE 8. MANAGEMENT FEE

The fixed management fee constitutes 2 percent p.a. of daily assets under management in addition to the variable management fee: 1/10 of better value development in percent in the fund's asset value compared with the reference index MSCI Emerging Markets Index Daily Traded Net Total Return \$, measured in Norwegian kroner. In case of poorer value development in the fund's net asset value relative to the benchmark, 10 percent of the difference will be deducted from the fixed management fee. However the total management fee may not exceed 4 percent p.a. of average assets under management.

NOTE 10. TAX NOTE

The fixed income funds are taxable with 28 percent of net realised capital gain on interestbearing securities, interest income accrued, currency gain/loss, minus tax-deductible costs, which, amongst other things, include management fee. The taxable net profit is in principle distributed among unitholders so that the fund is in a non-taxpaying position.

SKAGEN Høyrente Institusjon Note 8, 9 & 10

NOTE 8. MANAGEMENT FEE

The management fee constitutes 0.15 percent p.a. of daily assets under management.

SKAGEN Balanse 60/40 Note 8, 9 & 10

NOTE 8. MANAGEMENT FEE

SKAGEN Balanse 60/40 is not charged a management fee but the underlying funds are charged management fees in accordance with the prospectus for each fund.

The applicable management fee in the potential underlying funds are as follows:

	Fixed fee in percent p.a. of the daily assets under management	Variable management fee
SKAGEN Avkastning	0,5%	-
SKAGEN Tellus	0,8%	-
SKAGEN Høyrente	0,25%	-
SKAGEN Høyrente Institusjon	0,15%	-
SKAGEN Vekst	1,0%	1/10 of return above 6 % p.a.
SKAGEN Global	1,0%	*
SKAGEN Kon-Tiki	2,0%	**

1/10010etter value development measured in percent in the fund's asset value compared with the reference index MSCIAll Country World Daily Total return Net\$, measured in Norwegian kroner. *1/100 fbetter value development in percent in the fund's asset value compared with the reference index MSCI Emerging Markets Index Daily Traded Net Total Return \$, measured in Norwegian kroner. In case of poorervalue development in the fund's net asset value relative to the benchmark, 10 percent of the difference will be deducted from the fixed management fee. However the total management fee may not exceed 4 percent p.a. and may not be lower than 1 percent p.a. of average assets undermanagement.

NOTE 10. TAX NOTE

Equity funds are, in principle, exempt from tax on gains and do not have the right to deduct losses on realisation of equities when calculating taxable income. Furthermore, dividends received from companies within the EU/EEA are, in principle, tax-exempt. However, 3 percent of dividends received from these companies are treated as taxable to Norway.

Witholding tax on dividends received from companies within EU/EEA are deducted according to the decision made by Asker og Bærum District Court on the 19.11.2012.

 $Dividends\ received\ from\ companies\ outside\ the\ EU/EEA\ are\ taxable.\ The\ funds\ may\ in\ addition$ be charged withholding tax on dividends received from all foreign companies.

 $^{\scriptscriptstyle 1)}$ For liquidity in the portfolio as of 31.12.2013, please refer to the balance sheet.

^a RETER Geal Estate Investment Trusts) are listed, legal structures which are subject to favourable tax regulations in their country of origin. Conditional to receiving favourable tax treatment, the company must fulfill minimum requirements related to property exposure and a minimum share of the profits must be shared between owners.

Allocation of the acquisition cost: For SKAGEN m² the FIFO principle is applied when calculating the realised capital gain/loss when selling securities.

SKAGEN Vekst

Note 7. Securities portfolio as of 31.12.2013 (in NOK)

mera		
Yield to clients 1)		
Duration ²⁾		

¹⁾ Yield adjusted formanagement fee.

 $^{\prime\prime}$ Duration is a simplified expression of how much the price of the security will change if the interest rate changes by one percentage point.

³⁾ Yield is the average annual return of an interest bearing security until maturity.

⁴⁾ Securities are divided into six risk classes according to their credit risk. Class 1 has the lowest and class 6 the highest credit risk. Risk class 3: Government, and government guaranteed outside the EEA Risk class 4: County and local government Risk class 5: Bank and financial institutions Risk class 6: Industry

Risk class 1: Supranational organisations Risk class 2: Government, and government guaranteed within the EEA

 $^{\rm s)}$ For liquidity in the portfolio as of 31.12.13, please refer to the balance sheet.

All securities are traded in a telephone-based international market.

Unit price as of 31.12.2013 140,4571

NOK 37.178.870,- is allocated for distribution to unit holders. This will result in a reduction in the unit price equal to the distribution per unit at the time of distribution.

Allocation of the acquisition cost:

 $\label{eq:second} For SKAGEN \ Avkastning \ the \ FIFO \ principle \ is \ applied \ when \ calculating \ the \ realised \ capital \ gain/loss \ when \ selling \ securities.$

Portfolio key figures	2.85%													

¹⁾ Yield adjusted for management fee.	

Yield Yieldtoclients¹⁾

Duration²⁾

 $^{\rm 2)}$ Duration is a simplified expression of how much the price of the security will change if the interest rate changes by one percentage point.

2,85%

2,60%

0,11

³⁾ Yield is the average annual return of an interest bearing security until

maturity.

⁴⁾ Securities are divided into six risk classes according to their credit risk. Class 1 has the lowest and class 6 the highest credit risk.

Risk class 1: Supranational organisations

Risk class 2: Government, and government guaranteed within the EEA Risk class 3: Government, and government guaranteed outside the EEA Risk class 4: County and local government

Risk class 5: Bank and financial institutions

Risk class 6: Industry

 $^{\rm 5)}$ For liquidity in the portfolio as of 31.12.13, please refer to the balance sheet

All securities are traded in the Norwegian market.

Unit price as of 31.12.2013 103,7847

NOK 86.170.081, - is allocated for distribution to unitholders. This will result in a reduction in the unit price equal to the distribution per unit at the time of distribution.

Allocation of the acquisition cost:

For SKAGEN Høyrente the FIFO principle is applied when calculating the realised capital gain/loss when selling securities.

SKAGEN Høyrente Institusjon

SKAGEN m ²	NOK	-20 399 000
SKAGEN Balanse 60/40	NOK	17 884 000

The Fund Management Company's Board of Directors Responsibility for the Financial Statements

The Fund Management Company's Board of Directors is responsible for the preparation and fair presentation of these financial statements in accordance with Norwegian accounting act and accounting standards and practices generally accepted in Norway, and for such internal control as The Board of Directors determines is necessary to enable the preparation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's Responsibility

Our responsibility is to express an opinion on these financial statements based on our audit. We conducted our audit in accordance with laws, regulations, and auditing standards and practices generally accepted in Norway, including International Standards on Auditing. Those standards require that we comply with ethical requirements and plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditor's judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of accounting estimates made by management, as well as evaluating the overall presentation of the financial statements. We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements are prepared in accordance with the law and regulations and give a true and fair view of the financial position of the mutual funds as at December 31, 2013, and its financial performance for the year then ended in accordance with the Norwegian accounting act and accounting standards and practices generally accepted in Norway.

Report on Other Legal and Regulatory Requirements

Opinion on the Board of Directors' report

Based on our audit of the financial statements as described above, it is our opinion that the information presented in the Board of Directors report concerning the financial statements and the going concern assumption, and the proposal for the allocation of the profit in each mutual fund is consistent with the financial statements and complies with the law and regulations.

Opinion on Registration and documentation

Based on our audit of the financial statements as described above, and control procedures we have considered necessary in accordance with the International Standard on Assurance Engagements ISAE 3000, "Assurance Engagements Other than Audits or Reviews of Historical Financial Information", it is our opinion that the Fund Management Company's management has fulfilled its duty to produce a proper and clearly set out registration and documentation of the mutual fund's accounting information in accordance with the law and bookkeeping standards and practices generally accepted in Norway.

Stavanger, 30. januar 2014 **PricewaterhouseCoopers**
